1570. Any better rig?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-01 12:59:26 UTC
From: jch39_99
Topic: 1570 Message: 1570

I have been enjoying my TR-7 that I picked up about 2 months ago.
The fan has cured my drifting problems.

With RF gain reduced and using the Idiom Press SCAF filter between the rig and an outboard speaker/headphones, CW is an absolute dream to listen to.

My question ...
Are the other Drake rigs (B/C line, etc.) as good (or better) for easy listening CW?

73/Crit/K4BXN

Hello Crit,

Although I have operated a TR-7 many years ago I can't give a good comparison between the TR-7's CW audio and the B/C line. I do, however, have a highly modified R4C that I really enjoy, especially on CW. The Notch adjustment, passband tuning, and new INRAD filters makes CW copy quite enjoyable. I once owned a B line and enjoyed the R4B. It had nothing else to buy, the all in one receiver as I called it. It too operated quite well on CW, although I preferred the R4C over the R4B. This is not to say the R4B is not a good receiver, it simply means I like the R4C. I must admit I should never have sold the B line. But, that's water under the bridge.

Mike/Crit

I suppose it's down to the user and how they view it.

I use the R4C which is filtered up for both narrow and narrower CW - 2 filters. I also use the TR7 which has the standard SSB filter and the 1.8khz filter - (A & B)

I prefer the R4C in CW terms (I am CW only) and I don't think audio is very important with CW.

I don't often use the filters on the R-4C - as you said, the passband and notch take care of most situations

One of these days I am going to pick up a mike, talk into it and see what happens!! Do they bite?

Vic

Although the R4C NOTCH and PASSBAND TUNING controls can eliminate most adjacent frequency interference, the efficiency of these two controls is based on the IF filter's bandwidth. A poor IF crystal filter will allow quite a bit of garbage to come through and interfere with the station you are trying to hear.

A good CW filter and adjusting the PASSBAND TUNING, can eliminate most adjacent interference quite well. Audio filtering is a waste of time and money. I've tried that and although audio filtering does give the appearance of selectivity, the selectivity is only in the audio, not the IF. Therefore, a strong adjacent frequency signal will cause receiver desensing which will result in audio reduction and possibly lost of the signal one's trying to hear. This can even happen with the best of CW filters especially when the signal is within a few hundred Hz of the receiving frequency, although not a severe as it is with a receiver that either has has no CW filter or a poor CW filter and no PASSBAND TUNING or IF SHIFT control.

From: captcurt2000
Topic: 1578 Message: 1578

A while back Garey B. posted a great piece on the equivalent capacitances of various standard coax for use as injection cables for the Drake 4 line--

Can someone point me to that article or date?

Thanks

Curt

KU8L

1579. Re: [DrakeRadio] Posting on injection cable equivalents

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-04 15:53:04 UTC
From: Garey Barrell
Topic: 1578 Message: 1579

Curt -

All original cables were 38" long tip-to-tip.

The INJ cable used a foam inner dielectric and phono connectors with a white insulation. This cable measures 60 pF total capacity.

All other cables used the standard for the day clear polyethelene inner dielectric and phenolic (brown) insulated phono connectors and measures ~100 pF.

Original Drake INJ Cable = 19 pF/ft = .160" o.d. (foam poly)

RG-62 = 93R = 13.5 pF/ft = 0.240" o.d.
RG-59 = 75R = 14.8 pF/ft = 0.242" o.d.
RG-6 = 75R = 16.2 pF/ft = 0.270" o.d.
RG-174= 50R = 30.8 pF/ft = 0.110" o.d.
Mic Cable (Belden 8410) = Hi-Z = 33 pf/ft = 0.160" o.d. (foam poly)
Mic Cable (Belden 8421) = Hi-Z = 16 pf/ft = 0.180" o.d. (foam poly)
R/S Audio Patch Cable = 28 pF/ft = 0.165" o.d. (poly)

The best choice is the Belden 8421 Audio cable from their "Brilliance" line. It looks just like the other cables, and is very flexible. The RG-62 is OK, but it is 50% larger and far less flexible. RG-62 is also prone to shorting if bent over too small a radius, and is susceptible to heat damage when soldering connectors. The best "feature" of RG-62 is that it is often FREE, since there have been many miles of it pulled out of old computer networks. Belden 8421 is available by the foot from ACK Electronics in Atlanta. Other distributors have it as well, although many require purchase of a full spool.

The only pertinent factor is the total capacity, impedance and "loss" are not important.

Any _reasonably low capacity_ coax will work if the units are cabled together for the adjustment of the INJ trimmers.

The cable type ONLY affects the LEVEL of the PreMix signal, (5.645 MHz ABOVE the transmit/receive frequency,) and a small DC control voltage between the two. If the shunt capacity is too high, insufficient LO level for the first mixer will reduce the sensitivity of the receiver and the output power of the transmitter.

1580. Re: Posting on injection cable equivalents

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-04 16:42:10 UTC
From: captcurt2000
Topic: 1578 Message: 1580

Thanks again Garey:

What a tremendous resource!

I meant to print that when it first appeared but forgot.

I'm trying to get one of the AADE Drake displays to work at the higher bands. It is fine connected to just the tx or the rx but when the two are connected together, the level drops so it wont display.

When I connect the original inj cable to the rx, i get a noticeable drop in sensitivity of the rx.

I also see a drop when in transceive I switch from rx to tx control.

It doesnt seem to like the rg174 with bnc connectors at all--even re-tweaked with the inj trim. perhaps the added capacity of the bnc connectors is the problem. I'm going to try making up a harness without the bnc's using rg 58 or 59.

I've swapped v2 and v8 positions with no real difference.

all else works ok.

sensitivity difference is an s unit or two.

Thanks again for the info.

Curt

1581. AADE DFD1 Drake Display

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-04 20:15:30 UTC
From: captcurt2000
Topic: 1581 Message: 1581

Has anyone had experience using the AADE DFD1 digital display with r4a/t4x combo?

What did you use in the way of cable/connectors to get the injection signal into the display counter?

I'm having a problem due to low levels making the display quite sporadic above 7 Mhz.

I'm thin king it might be a good place for a simple MMIC amplifier at the rx to drive the display cable.

Thanks

Curt

Hi Everyone ,
I have a question about my Drake TR-4 . I've been running it as my main radio for a little while now and to begin with the only problem I had with it was a weak 12AX7 tube , which I replaced . After that it ran fine for awhile ... until one night when it started keying itself up . :(

Since then I replaced the 6EV7 tube thinking that it was a weak VOX/Relay tube , but it's still keying itself up ... does anyone have any suggestions as to what would be causing this to happen ? I was told that the 12BY7A or the 6EJ7 may be leaking so I ordered a new one of each but they haven't arrived yet . I'm hoping this fixes it but just in case it doesn't I thought I'd ask here . Any help or information would be greatly appreciated, I love my Drake setup and hate not being able to use it .

From: Garey Barrell
Topic: 1583 Message: 1583

The XMTR GAIN should not be over halfway, likewise the VOX GAIN shouldn't be more than 50%.

The 6EV7 is the first suspect in this sort of problem, but you have already replaced that! Assuming that this was a new tube, and good, the next step is to check the Bias supply in the AC-4. Voltage should be about -60 to -65VDC in the TR-4, with NO ripple.

Is the Idle current for the Final correct at 100 mA? Have you had to adjust it recently?

If the Bias supply is OK, the next suspect is C145B, which is one section of the Twist-Lok filter capacitor. This can be checked by paralleling a good cap of the same or larger capacitance and voltage ratings, or by using an ESR meter.

Beyond that, we're into checking resistor values in the VOX circuit, and other measurements.

Delbert,
The 10 uF electrolytic capacitor connected to the cathode of the 6EV7, C145C, can cause this if it gets leaky. You might try replacing that. In fact, it's probably a good idea to replace all the electrolytic capacitors in your Drake if they are original.

It sounds like the crystal is not actually oscillating on 21.100 MHz.
You need to check it with a frequency counter.

Wink -

Several possibilities..

Crystals are made for a specific load capacitance, i.e., the capacity they "see" when in circuit.

They are also made for either Series or Parallel operation, again meaning whether they are used in the Series resonant mode or their Parallel resonant mode.

Back in the old days, 32 pF and Parallel resonance were pretty much the "standard". I'm going from memory here, so may be wrong, but I believe Drake crystals are spec'd for a 20 pF load, and Series resonant. It's not something I need to know, because when I need a crystal, I just order it from International Crystal Mfg, and tell them it's for a Drake. When it comes in, it's on frequency!

One other variable is that crystals "age" with age (!) and typically drift up in frequency a small fraction of a percent per year depending upon how they were cut.

So.... Depending upon the source, specifications and age of the crystal you have, I'd say it's off it's marked frequency by 15 kHz due to some or all of the effects noted above.

One other thing. The T-4X(any) transmitters must NOT be used on 30M with a 21.1 MHz crystal!! Because of the frequencies running around in the transmitter, (and their second harmonics,) multiple spurious signals are generated when the PTO is set for operation the 10.100 to 10.150 range. The only "safe" crystal frequency for the Band Oscillator crystal in the transmitter is 20.8 MHz. The 21.1 crystal is ok for the receiver.

I just went through my service manuals for the TR7 and noticed that in
the early one R1187 did not exist, in an intermediate one, it was there,
and looking at the photograph of the card, it seemed as if they had done
just what you have done, lifted the leg of CR1119 and added the R1187.
In the latest manual R1187 had a place on the PCB.

I.e. it seems as if this was a fix made early in the production of the TR7

Could be interesting to know when this fix appeared in the TR7 series.
So what serial number does your TR7 have? And for others that miss the
R1187 resistor, what serial number does your TR7 have?

You probably want to start with the power supply rebuild kit from The Heathkit Shop:
http://www.sunlightenergysystems.com/theheathkitshop/index.html
(Apparently the website is currently being updated, but trust me, they have a first rate rebuild kit for the Drake AC-3/AC-4 power supply)
I don't know of anyone that is advertising up complete recap kits for the TR-4, but I would start by replacing the electrolytics, then the paper (non-ceramic) caps; then any silver micas that have a lot of DC voltage across them.

Hi everybody,

I just joined this group to learn more about the Drake SW8. I am an avid SW listener, and here is a partial listing of my radio collection:

Sony:
CRF-320, 6800, 6700, 2010, TFM 1600, TFM 1000 WB, SW-1S, SW-07, SW 55, SW 77 and a variety of small Sony radios...

Grundig Satellits:
210, 205, 2100, 3400, 300, 400, 500, 700, 800 (somewhat similar electronically to SW8)

Eton:
E-1, S350, S350DL

Panasonic:
RF-B65, RF-B40

Although I had been using all my radios on their internal whip antennae, I recently purchased a Wellbrook Loop to enhance my receiving.

Looking forward to hearing from the group.

Regards,
Arthur

As Bob said, start with the power supply, whether it be the AC3 or AC4. The Heathkit Shop, as Bob stated, is one source to replace the caps, diodes, and resistors with a complete kit.

As for the TR4 itself, in most cases, the only capacitors you "might" need to replace are C145A/B/C (20/60/10ufd), triple capacitor can behind the right front panel and C135. Notice I said you "might" need to replace. This doesn't mean you should replace them. In most cases, unless the TR4 is showing signs of instability you more than likely will not have to replace these caps. In addition, unless the mica and disc caps show signs of physical or overheating damage and the TR4 shows signs of instability, then I doubt you will need to replace any of the disc and mica caps. Resistors, over times and use, do change values. However, again, if the TR4 is operating properly, then most likely you will not need to change resistors.

If you replaced the power supply capacitors, resistors, and diodes, set the bias as instructed in the manual, and the TR4 appears to be operating properly then there's nothing else you need to do other than enjoy the radio. I do recommend, however, to check the final neutralization by following the manual's neutralization section.

A fan installed on the rear of the final cage is a highly recommended addition. As you may have found out, the final cage can great quite warm during normal operation. A small 12VDC muffin fan mounted on the rear of the final cage powered by a 1/2 wave rectifier from the filament supply under the chassis will do wonders at keeping the final's cool. Of course, if you chose to place a fan on the top of the final cage powered by a separate 12VDC supply, that too will work. The only difference is a fan powered off of the TR4's filament supply through a 1/2 wave rectifier circuit is controlled by the TR4's power switch. Your choice.

Del -

As usual, you'll get more than a few opinions on this type of question.

Bob and Mike have covered the subject, and I agree with some of both! (Also typical!)

The AC-4R is the place to start, I think we all agree on that. It is a little more problematic to
adapt it to the AC-3 because of the physical layout, but unless you have one of the very first
AC-3s, (the one with the big choke on top of the chassis,) the AC-4R will adapt quite nicely. What
you DON'T want is for the Bias supply to fail in the AC-3, because if it does, the PA tubes,
components, power supply and window curtains are all at risk, even if the transceiver is sitting in
receive mode when the failure occurs!!

While many of the AC-(any) power supplies are working today with the original filter caps, 30-40
years after manufacture, the fact is they are all living on borrowed time! Reliability engineers
figure 10 year life for electrolytic capacitors in power supplies, which while being conservative,
is still a long way from 30+ years. While measurement with an ESR meter (or at least ripple
magnitude with a scope) can give you some assurance of the general condition of electrolytics,
without either or both of those tests you are playing Russian roulette. Some electrolytic caps fail
gracefully, i.e., the electrolytic evaporates, the capacitance goes toward zero and the radio emits
a loud hum to announce the demise. BUT, a good percentage of electrolytic caps fail by shorting,
and there are several things that happen when an electrolytic capacitor shorts out, none of them
good! So unless you have measured their apparent condition and are satisfied that at least for
today they are OK, it's best to replace them.

I have worked on a LOT of Drake equipment over the last 50 years, and I have yet to find either a
film or mica capacitor that has failed, UNLESS it has been damaged by either a hot soldering iron
being applied to the SIDE of it, or had it's lead(s) pulled out of the body by excessive mechanical
force. I HAVE seen a very few ceramic disc caps that have failed with no apparent damage,

although
they may have been overheated by excessive soldering times or tools. Some resistors, especially
very high resistance (2 - 20 Meg), are found to have increased in value. This happens infrequently
enough that it's reasonable to wait to replace them when they cause an operational problem. These
failures are not catastrophic, but usually show up as slow VOX release times and other annoyances
that finally get bad enough to require attention.

My process with a "new" piece of equipment is to first check the fuse-holder(s) to ensure that the
correct fuse is installed, (and not a piece of #6 copper wire cut to length,) check the ESR of all
electrolytics, and if all looks good, turn it on. Assuming no untoward noises or smells and
apparently nominal operation, proceed to make voltage checks per the table in most manuals. While
these voltages are not always "correct", (Drake didn't always change the voltage charts when circuit
changes were made...,) if a number is too far out of line you can usually find out why by looking at
the associated circuitry. If not, then further troubleshooting, resistor value checks, etc. are in
order. Next, an alignment is performed, and any adjustment that is WAY out of where it should be
indicates that something may have changed and should be investigated further, rather than just
"adjusting it out".

Certainly any of the Drake tube type transmitters benefit greatly from the addition of a small fan
on the top or back of the PA cage, blowing OUT. It doesn't take a LOT of air, just a gentle, quiet
breeze to assist the designed convection cooling AND to move the exhaust air away from the area.
What fan you use and how you power it is purely a matter of convenience and/or what you find at the
hamfest.

This behavior is quite likely the result of either a failing bias supply
in the AC-3, or a resistor increased in value. Or section C145_B_ of
the internal electrolytic.

1605. Replacement Electrolytic Capacitors

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-07 18:09:56 UTC
From: Garey Barrell
Topic: 1605 Message: 1605

Tom has updated his website to show at least part of the line of replacement electrolytic capacitor kits that he offers for Drake and other equipment.

These caps are attractive and well designed, having the same basing style as the originals and 105 degree C rated capacitors, and reasonably priced.

I agree the adding of a small fan to keep the air moving. I have added a very neat 2 fan assy inside my KWM-2 that I saw at a local hamfest and have since ordered from a ham down near Houston who is building these (also for 32S transmitters). They are really neat looking and in my opinion look like factory. They are easily installed w/o altering the stock appearance and easily removed. Maybe one can look at these and get an idea of what I am talking about. I have added a pic of this in the Drake Group pics.

correct fuse is installed, (and not a piece of #6 copper wire cut to length,) check the ESR of all
electrolytics, and if all looks good, turn it on. Assuming no untoward noises or smells and
apparently nominal operation, proceed to make voltage checks per the table in most manuals. While
these voltages are not always "correct", (Drake didn't always change the voltage charts when circuit
changes were made...,) if a number is too far out of line you can usually find out why by looking at
the associated circuitry. If not, then further troubleshooting, resistor value checks, etc. are in
order. Next, an alignment is performed, and any adjustment that is WAY out of where it should be
indicates that something may have changed and should be investigated further, rather than just
"adjusting it out".

Certainly any of the Drake tube type transmitters benefit greatly from the addition of a small fan
on the top or back of the PA cage, blowing OUT. It doesn't take a LOT of air, just a gentle, quiet
breeze to assist the designed convection cooling AND to move the exhaust air away from the area.
What fan you use and how you power it is purely a matter of convenience and/or what you find at the

hamfest.

Referred by folks from the boatanchor group.
After several years of idleness, my TR-7 isn't working. I'll ask questions once I've done some digging and can ask rationally.
In the meantime, what's a good source for extender boards for this radio. Google came up with WB4HFN's page, which looks pretty good, considering the original kit is made of unobtanium.
I did replace a shorted tantalum in the +10 supply; unfortunately, the radio still doesn't work. Sounds like a synth problem, since there's normal background noise, so the gain stages seem alive. I'd like to do some bench work with the extenders before asking further.... I do have the service manual.
When alive, the TR-7 either runs barefoot, or drives a Viking desk pedestal KW through a 6db pad.

Thanks,

Thanks to all for the replies,
A note from our friend Bill Frost gave me the answer
as well. I had two 21.1 xtals and one of them I remember
worked in the T-4XC before so I switched them out, and sure
enough it worked fine in the T-4XC.
Turns out the R-4 requires parallel resonant crystal
and the T-4XC a series resonant crystal....
I never knew this and I don't know how you would be
able to determine it when buying one on the internet.
Just take a chance. This is first time I've gotten one
that did not work correctly, but it is close enough.
Thought you all might like to know this info.

1609. Drake Extender boards Attn:K2AHC

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-07 21:36:23 UTC
From: Don
Topic: 1609 Message: 1609

I just got off the phone with Bob ROLFNESS, W7AVK. He has managed to get enough parts together for a few more kits, so Bob now has 20 Drake Service kits ready to ship. The cost of a kit is $60 plus postage. In the USA and using priority mail the total cost is $64.80. I purchased one of his kits about 4 years ago and have been very happy with it. I did have to trim the edges on a couple of the boards so they would fit side-by-side, otherwise they have been great.
Bob gave permission to post his info here for any who might like a set.
His e-mail : W7AVK@... which is also his paypal address.
He may be contacted by phone at : [509] 750-7589.

Wink -

Good that Bill is keeping an eye on us!!

By the way, the R-4 is the ONLY version that is parallel resonant
because it is the only one with a tube based Band Oscillator. All the
others, R-4A - R-4C and all the T-4(any) transmitters have a solid-state
Band Oscillator that uses series resonant crystals...

But you still do NOT want to use that 21.1 crystal in the T-4X(any)!!!

Hi Don - Thanks for the call, enjoyed the chat.

Here is a canned message I send when information about the kit is requested by a CONUS ham. Feel free to reference Ron Baker's wb4hfn outstanding DRAKE web site or my home phone, email, etc. Was having ISP troubles and Ron agreed to moved my kit page to his site to have more of the TR-7 data in one place.

73 Bob W7AVK

Thanks for the note and interest in the kit. Congratulations on the TR-7, its a fun radio.

Yes, I have been supplying a set of Extender Boards and the DIGITAL JUMPER card supporting the Drake TR-7 and R-7 for the last eight years. You might check http://wb4hfn.com/Services/W7AVK/tr7ext2.htm for more information if you have not already seen it. The cost is $64.80 which includes priority postage.

You can either send a check or mo to the address below or use paypal as I've just joined it. If you go the paypal option please send $67.10 as they charge the seller for their transfer service. My paypal id is w7avk@....

I have several kits completed, tested, boxed, and ready to mail. Attached is a photo of the extender boards in operation. The kit is complete except for four small plastic tuning tools which I figured most of us had already so didn't supply to save cost. I also don't supply the card extender tool. Its used only for and came with the DR-7 Digital Readout board which was originally an option and is almost not needed being a U shaped coat hanger wire with a hook in each end.

My address is:

Bob Rolfness, W7AVK
5581 Panorama Drive NE
Moses Lake, WA 98837
509-750-7589

Good luck with a great radio.

An unsolicited testimonial: I ordered the kit, and it arrived today.
Everything looks very very nice, and the instructions that came with it
are worth the price of admission. I'll be cleaning all the connectors, and
figuring out why the +10 won't adjust below 10.3 before I start active
troubleshooting. Then if I hit the wall, I'll look for advice here.

1614. transceive drift

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-12 16:47:29 UTC
From: captcurt2000
Topic: 1614 Message: 1614

Anyone with experience improving the transceive offset drift in
R-4a/T4x pairs?

Its fine after a long warm-up but seems to change day to day. I've
been thinking of putting an extension on C-61 and a knob on top of the rx!

Would replacing the trimmer with a very high quality piston type
improve this at all or is it all the problem of two different crystals
drifting as they warm up?

I've pretty much decided to build a DDS-based VFO that would feed both
the rx and tx. I could also do a tcxo based "xtal replacer" and
supply both the 5595 and 5645 freqs from a common base. (I think I can
at least.

Not easy, but it could all be external.

Why would I do this?

Frequency stability and accuracy is very important for WSPR and JT65
modes in particular. In all other respects, the pair is working
fine--including other digital modes not quite as susceptible to
frequency inaccuracies.

Thanks

Yeah, there were some Yellow ones. MOST of what I have seen over the last 40 years have been Blue or Green, with fewer Red, and I believe only one Yellow. Kinda makes me think they were out-liers and probably worst case slopes.

When I was using the R-4/A and T-4X on Autostart RTTY (14.075 MHz) 24/7 back in the 60's, I used an International Crystal High Stability crystal to Crystal Lock the receiver, and let that control the transmitter. The receiver would sit on frequency for weeks, and the transmitter could be "fine-tuned" with the RF TUNE to keep it steady. The transmitter would stay for several days to a week as long as the room temp stayed constant. The fan on the back of the Final cage kept the internal temperature steady, with no fan the transmitter frequency would shift enough from standby to transmit to be problematic. Of course I ran full power, 130W or so with transmissions sometimes in excess of 30 minutes.

Xcelite makes a 6" screwdriver about the size of the pocket clip line, green handle. I had one of those for a while that I had cut off about a quarter inch of the handle on the blade end. The blade was small enough to fit through the existing perf in the cabinet top, and with the handle trimmed was able to reach C61. A piece of heat-shrink tubing over the C61 adjustment screw kept the blade in the slot. Fun times! :-)

You might check with ICM. Their standard crystals are good enough that they might be plenty stable enough at only 5.5 MHz. The crystals we used for Crystal lock were are 18-19 MHz, and were from a line that had a near zero tempco over a typical room temperature range.

Topic: 1619 Message: 1619

Hello to all,

My R4 receiver when I first got it a month or two ago had a very slight hum which has now gotten very bad and can't use the receiver. To hear anything at all I turn the AGC off and when I tune in a signal it is very garbled. I am assuming it is in the p/s so my question to all is which caps should I look to replace and are these caps available? I have to download a schematic from The WB4HFN site since the receiver had none. Any help would be greatly appreciated. Thanks in advance to any that reply.

The serial number is 3827, but I suspect that the IF/Audio board is older than that. When I obtained this rig a few months back, it was in pretty rough shape, and displayed evidence of being worked on many times.

I am very happy with my Alpha 374A. I run it with a "B" Line, but it is far more modern than the "B" Line, and should work well with a TR-7. Back off the TR-7's output power, to arrive at your desired final output power, with one of these babies. But, most anyone here will tell you, you can't go wrong with an Alpha.

Dan

I really like my Ameritron AL-80B. It uses a single 3-500ZG tube. Max power output is in the 750 Watt range, which is plenty. The amp runs very well on 125 VAC, I might add, so if you don't have 240 VAC in your shack, that could be a consideration. Their nifty instantaneous bias circuit means that the tube draws virtually no idle plate current, so it runs much cooler than other 3-500Z amps, puts less stress on its power supply, and is also more energy-efficient. My amp saturates at about 65 Watts of drive.

You can pick up a nice used AL-80B in the $800 to $850 range. I got mine for $825 and have had no trouble with it whatsoever.

1628. TR-4CW/RIT weak AM

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-15 13:52:28 UTC
From: DALE PARFITT
Topic: 1628 Message: 1628

I have finally had an opportunity to use my TR-4CW/RIT in AM (before installing a switched 6KHz Inrad filter) and find plate current peaks only about 100mA at best. Resting Ip is very, very low- but perhaps that is the way it was designed. The manual warns to limit peaks to 200-250mA- no way I can approach that level. Low power out. I will be trying another screen modulator tube- anyone have an idea if I should be looking elsewhere? Works FB on SSB/CW.

Tnx,

Dale W4OP

From: w5rkl
Topic: 1628 Message: 1629

Hello Dale,

Drake uses controlled carrier screen modulation in AM. Controlled Carrier Screen Modulation operates similar to single sideband but with a small amount of carrier until modulation is applied, hence "controlled carrier". In AM, a voltage is applied to the balance modulator to cause it to become slightly "unbalanced". This slight unbalancing of the balance modulator allows the carrier generator signal to appear at the output of the balance modulator and to the other circuits that follow. At the same time the AM modulator tube holds the driver tube's screen voltage at a lower voltage resulting in a reduction in the RF drive to the final tubes, hence low idling output power in AM.

Speaking into the microphone causes the balance modulator to become "more" unbalanced, just as in single sideband suppressed carrier, allowing a variable increase in the carrier generator's RF signal level to flow through the balance modulator and on to the other circuits. At the same time, the AM modulator tube also varies the driver tube's screen voltage causing the driver tube's output to vary at the same rate as the audio applied to the balance modulator.

As in sideband, the level of audio output from the speech amplifier's output applied to the balance modulator and, in the case of AM, the AM modulator tube, determines the level of RF output from the final amplifier. Therefore, you might try increasing the MIC gain setting slightly. However, having said that, do not increase the MIC gain setting too much as this will create distortion in the output signal just as in sideband.

In most, but not all, controlled carrier screen modulated AM transmitters, especially in the case of Drake transmitters/transceivers, AM is transmitted in the LSB only, not both sidebands.

Subject: [DrakeRadio] Re: TR-4CW/RIT weak AM

Hello Dale,

Drake uses controlled carrier screen modulation in AM. Controlled Carrier Screen Modulation operates similar to single sideband but with a small amount of carrier until modulation is applied, hence "controlled carrier". In AM, a voltage is applied to the balance modulator to cause it to become slightly "unbalanced". This slight unbalancing of the balance modulator allows the carrier generator signal to appear at the output of the balance modulator and to the other circuits that follow. At the same time the AM modulator tube holds the driver tube's screen voltage at a lower voltage resulting in a reduction in the RF drive to the final tubes, hence low idling output power in AM.

Speaking into the microphone causes the balance modulator to become "more" unbalanced, just as in single sideband suppressed carrier, allowing a variable increase in the carrier generator's RF signal level to flow through the balance modulator and on to the other circuits. At the same time, the AM modulator tube also varies the driver tube's screen voltage causing the driver tube's output to vary at the same rate as the audio applied to the balance modulator.

As in sideband, the level of audio output from the speech amplifier's output applied to the balance modulator and, in the case of AM, the AM modulator tube, determines the level of RF output from the final amplifier. Therefore, you might try increasing the MIC gain setting slightly. However, having said that, do not increase the MIC gain setting too much as this will create distortion in the output signal just as in sideband.

In most, but not all, controlled carrier screen modulated AM transmitters, especially in the case of Drake transmitters/transceivers, AM is transmitted in the LSB only, not both sidebands.

Mike
W5RKL

Hi MIke,
Thank you for your reply. I am very familiar with the controlled carrier

modulation- and how Drake does it.

What I am looking for is why my Po is so low in AM mode- perhaps 10-20W on audio peaks, and an idea of what idling Ip should be in AM mode.

Tnx,

Dale W4OP

Here are a couple of good references for AM with the T-4X/C. Same
circuit in the TR-4C, but watch the power!!!!

<http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/T4X_AM_Modification.htm>

<http://www.wb4hfn.com/DRAKE/DrakeArticles/HiFi_AM_T4X.htm>

And for the TR-4C specifically.

Meant to mention.....

The ONLY way to see what your PEAK power is, is with a scope. SOME so called "peak reading wattmeters" come close, but nothing beats a scope. You might be surprised to see what your power really is. The Drake meters are VERY heavily damped and don't do "peak" very well at all!!

I've never tried to run AM with any of the Drake transmitters. I don't have a TR-4 set up at the moment, but I suspect you would not see any increase in plate current above the 100 mA idle current. The carrier OUTPUT should be about 15-20W with no modulation. The carrier level is kept very low with no modulation to minimize dissipation, and increases with modulation to support the sidebands. An AM receiver isn't very happy with this type of modulation as the AVC follows the carrier level, making it look like an SSB signal on the S-Meter, just one you can understand! If the receiver has a Slow AVC function, it's much more pleasant to listen to.

Bottom line, it's not a very useful feature, and was included only to allow users of what was intended to be a mobile transceiver to at least talk to the AM fixed and mobile stations that were still quite prevalent when these transceivers first came out. Many AM users today are not very tolerant of these types of signals since they are not very pleasant to listen to on typical AM receivers.

I just checked my T4XC in AM. The final amplifier idling current, no modulation, is approx 100ma showing about 10 watts of carrier into a dummy load. With the MIC gain turned up to 10 o'clock, LOAD control set at 10 o'clock, using an unamplified D-104 and normal voice produced an average power output of 50 watts on peaks using the Drake MN-2K watt meter. The watt merer is not a peak meter just average. Naturally with 3 final tubes the no modulation final amplifier idling current may be slightly higher along with higher RF output on voice peaks. As Garey said, I also do not have a TR3/TR4/TR4C etc to compare these figures with.

I agree with Garey, many AM folks running DSB plate modulated AM don't care for CCSM AM. Been there and been told just that. The first thing that is usually commented on it only one sideband is being transmitted. With the Drakes, as you know, this is true, LSB only.

I'm fixing that by replacing the filter caps in my Heathkit Apache TX-1. That AM transmitter sounds very good since the speech amplifier was modified.

Merry Christmas/Happy Holidays

If the receiver has a Slow AVC function, it's much more pleasant to listen to.

Hi Garey,
That is my concern then- as resting plate current appears to be around 10-25mA when in AM mode. I believe this is a function of the screen modulator tube- so I'll start looking there. One mod reported raising this resting value (with the attendant dissipation). But for now, I'm just trying to see if everything is nominal in AM mode- which it appears it is not.

Thanks Garey- more work to do.

Dale W4OP

Perfect Mike,
Just what I was looking for. I have some researching to do.

I have a very nice mod that allows a 6KHz Inrad filter to be used on AM. It is activated by pulling out on the RIT knob (after replacing it with the same value + a push pull switch).
When in-line, both the USB and LSB lamps are illuminated to remind one that the 6KHz filter is now in line.

Tnx agn,
Dale W4OP

1638. AC-4 Recap

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-16 18:05:54 UTC
From: w5rkl
Topic: 1638 Message: 1638

Looking through various AC4 schematics I noticed not all AC4 schematics are the same. The one I have in my T4XC manual shows the following caps in the LV supply:

C3 = 100ufd 350VDC

C4A = 100ufd 350VDC

C4B = 80ufd 350VDC

The AC4 manual schematic on the Internet (bama) shows the following:

C3 = 100ufd 350VDC

C4A = 80ufd 350VDC

C4B = 80ufd 350VDC

Would it be safe to assume replacing all 3 capacitors with 100ufd at 350VDC be acceptable? Any increase in voltage would be small, if any increase at all.

The bias supply filter caps on both the Internet (bama) and my T4XC schematic shows both C5A and C5B as 20ufd at 150VDC but the Internet AC4 manual's parts list shows these two capacitors as 40ufd at 150VDC each. Must have been a change that wasn't reflected in the parts list, only in the schematic.

I was considering replacing C3, C4A, and C4B with 100ufd at 350VDC each cap. The bias supply caps with two 22ufd at 160VDC caps.

The HV caps, 125ufd 400VDC caps, I am considering replacing with 140ufd 500VDC caps. 125ufd 400VDC caps are difficult to find, if one can find them.

New 1N4007 diodes for all original diodes.

I know about The Heathkit Shop and the AC4 upgrade kit.

Mike -

No problem with the values you suggest, except for the Bias supply. Drake did change from 20 uF caps to 40 uF caps per the 1976 parts list, so I would suggest you use 47 uF for those two. They also changed C4 to a 100 / 100 uF @ 350V.

The 140 uF for the HV supply would be fine. Keep in mind that the original caps were spec'd at +80 / -20% tolerance!

Yes you can do as you suggest.

However, I would highly suggest you install one of The Heathkit Shop replacement AC-4R boards made for a Drake AC-4. This will completely rebuild you power supply with modern easily obtainable parts. See this URL: www.theheathkitshop.com Many a AC-4 have been converted with this great product.

From: Steve Finch
Topic: 1638 Message: 1643

If the capacitor ☐looks☐ intact, I will try to reform the capacitor before replacing. I generally hold to the following principles:

1. Many older electrolytic can be ☐reformed☐ and will work fine. I generally lift the + terminal off and try to reform in place using my variac and a simple diode ring rectifier with a 100 ufd, 450 v. capacitor to give me DC. I start at one half the design voltage DC, and move up to the design voltage in 25 voltage steps for 30 minutes at each voltage. I also have a 1k ohm, 2 watt resistor in the DC line to limit the initial current inrush into the reforming capacitor. After the initial inrush, the current essentially drops to zero. If it stays more than 10% of the supply voltage, you may have a ☐leaky☐ capacitor.

2. If I decide or need to replace the electrolytic, I always use the design voltage or higher. Once a capacitor has been used at a lower voltage, they tend to stabilize at the lower voltage and are not useable at the higher ☐stated design☐ voltage any more.

3. I will substitute up to 25% ufd higher on the electrolytics. Too much more than that could stress other components especially during the initial inrush of current immediately after turning the unit on.

I uploaded an article about reforming electrolytic capacitors into the Files area of the newsgroup.

Subject: [DrakeRadio] AC-4 Recap

Looking through various AC4 schematics I noticed not all AC4 schematics are the same. The one I have in my T4XC manual shows the following caps in the LV supply:

C3 = 100ufd 350VDC

C4A = 100ufd 350VDC

C4B = 80ufd 350VDC

The AC4 manual schematic on the Internet (bama) shows the following:

C3 = 100ufd 350VDC

C4A = 80ufd 350VDC

C4B = 80ufd 350VDC

Would it be safe to assume replacing all 3 capacitors with 100ufd at 350VDC be acceptable? Any increase in voltage would be small, if any increase at all.

The bias supply filter caps on both the Internet (bama) and my T4XC schematic shows both C5A and C5B as 20ufd at 150VDC but the Internet AC4 manual's parts list shows these two capacitors as 40ufd at 150VDC each. Must have been a change that wasn't reflected in the parts list, only in the schematic.

I was considering replacing C3, C4A, and C4B with 100ufd at 350VDC each cap. The bias supply caps with two 22ufd at 160VDC caps.

The HV caps, 125ufd 400VDC caps, I am considering replacing with 140ufd 500VDC caps. 125ufd 400VDC caps are difficult to find, if one can find them.

New 1N4007 diodes for all original diodes.

I know about The Heathkit Shop and the AC4 upgrade kit.

Comments?

Probably my favorite mike is the Kenwood MC-50, but will swap between
the Shure 444, EV664. Just be sure it is a HI-z mic.
Unless the stock filters are bad would just leave them stock.
Do an alignment if it hasn't been done in a while.
Cheers,
Tim

1647. Drake 2-A/2-B question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-21 22:19:29 UTC
From: py2xb
Topic: 1647 Message: 1647

I am working on a Drake 2B which is functional but has low sensitivity on all bands (almost dead on 15/10m)

I have checked tubes, resistence chart and voltage chart. The only huge difference I have found rergards the DC voltage on G1 of V3 (pin 1). It is a 6BE6 (2sd mixer & VFO). The VFO circuit uses this grid to oscillate BTW.

The chart says -.5V I find +2.7 volts. The VFO works because I am tunning stations (even though with very low sensivity) . I have replaced the tube and nothing changes. I have checked the bias resistor and cathode resistor. Both ok.

I am puzzled because I am wondering if there isn't something wrong that I cannot see.

BTW when I introduce the probe to make the measurement, the reception goes away (it seemed the VFO halts). I am unable to say if this is normal or not. I am using a high impedance VTVM.

Any input on this is very much appreciated.

Regards Fred PY2XB

Fred -

Just about any meter will kill that oscillator, and that is why you are seeing an incorrect voltage.

What sort of antenna are you using? There are seldom any signals on the 15 and 10M bands these days except on contest weekends.

Do you have the crystal calibrator installed? If so, what does it read on the various bands? If not, do you have another receiver with a crystal calibrator that you can connect "antenna-to-antenna" for a reference signal.

Whatever problem your 2-B may or may not have, it's NOT the voltage on the grid of V3! :-)

Garey, thanks for the input. I have low sensivity on 80 and 40m too. I have a dipole on 80m and a Yagi on 40m. It is like that across the board.

I've discarded that the wrong reading is because the oscillator halts. The reason I did is because the voltage is on the manuals' chart. I suppose they have actually measured the -.5V with the 11Mohm VTVM. However, if this is the reason the pb is some place else.

I have not yet started the alignment procedure. Perhaps some IF stage went crazy and needs alignment. I am trying to check the circuits b4 going to this procedure.

I can check on all bands with an accurate RF generator, BTW.

Thanks again. Fred

P/S I am still looking for inputs !!! or Tips...

From: py2xb
Topic: 1647 Message: 1652

For those who are interested on unusual problems :

I have circled the faulty stage as being the 2sd IF section (455 Khz).
After checking resistors and capacitors, the guilty part seemed to be
the IF transformer. I have retrieved it from the chassis and opened
the metalic can. There it was ! The top ferrite slug was broken in
pieces. So the IF stage was completely detuned.

Is that normal ? The receiver has been transported but there is no
sign it has got a punch.

I have replaced the ferrite by another 455KHz transformer slug,
reassembled the part and aligned the IF stage.

It is a beautiful receiver. Probably one of the best SSB receiver of
its time.

Happy Holidays

Fred -

Good catch! I doubt if the slug broke "by itself".! :-) Most likely
a previous owner damaged it with either an improper tool, or, it was
stuck and force was used to try and "fix" it....

Fortunately the IF is at 455 kHz, meaning there are millions of cans
just like it out there.

The 2-B was definitely a "watershed" receiver design. It was one of the
first receivers to break with the built like a battleship HEAVY designs
of the past. Many of those receivers, especially Hallicrafter's brand,
were so mechanically unstable that you couldn't walk across the floor
without the receiver "bouncing" frequency with every step. Contrast
with the 2-B, which we would demonstrate by tuning in a CW or SSB
station, lifting the front of the receiver an inch or so off the desk
and dropping it. The received tone would "bounce" momentarily and then
return to right where it had been! Most would buy it on the spot! It
will still hold it's own with modern receivers in all but absolute
selectivity and close-in strong signal rejection. For day to day
hamming, it will hear anything a modern receiver will.

Garey and Jerry

The IF transformer's top screw seemed to be untouched. I do not know how it happened . According to your comment Garey, you would think that someone played with it before. It is possible.

I need to clean it up, so I have to disassable the front panel. There is a plastic sleeve on the passband tuning shaft. It is necessary to take it off in order to remove the switch lever ? It is tighted to the shaft. Everything is straight forward except by this part. Help appreciated.

Garey I see you have a maintenance CD for the 2-B. It will be useful here. Would you mind to email in private ? py2xb@...

I also have a Drake 1A which is somewhat older than the 2-B. The 1-A was a good start for Drake. I don't like the enclosure, but the receiver is very good for its time.
I agree on stability differences. I have just restored an AA5 S-38C. Taken in account the different price tag at that time, Drake is a total different animal.

Jerry-

Check to see that there are crystals installed for the other bands.
Maybe only the one for 80 is there.

Joe.

Jerry -

I'm away from home and don't have all my info with me, but the 2-C is essentially an 80M receiver with a crystal controlled converter in front of it. So most likely the problem is that the Band Oscillator is not running. I believe this oscillator is Q1, and it's mixed in a 12AU6, V2.

1662. Tuning Question for a TR-4Cw

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-23 21:36:00 UTC
From: Peter
Topic: 1662 Message: 1662

I am having some confusion tuning my Drake TR-4Cw. I have a reproduction printed instruction manual. My question pertains to Chapter III entitled "Operation". Section 3-7 in the 5th paragraph reads "Rotate the Mode switch to the X-CW postion and advance the XMTR GAIN control until the plate current meter moves up scale slightly". This is on page 3-5. What exactly does this mean?? If I take this literally I set the Mode switch to X-CW and then turn the XMTR Gain control clockwise until the needle on the meter starts to move up its scale slightly and then move on with successive tuning steps. If I follow this procedure I will get absolutely no dip on the plate control. If I set the XMTR for max reading on the plate current meter I do get a dip on the plate control adjustment. What is the correct method. Maybe its just me but I don't find the wording used in the original manual to be well chosen or specific enough for a new guy. Thanks & 73, Peter.

Peter,
I suppose "slightly" means enough that you can see a perceptible dip in plate current when tuning the plate adjustment. In my experience, this means initially setting the Xmtr Gain for 100 to 150 mA above idling current. I think the point is to try to get the plate tuning adjustment close to resonance before increasing the RF drive to the level used at full power output. This keep the power dissipation in final amplifier tubes lower than it could be with a mistuned output network with full RF drive.

1664. R4B receiver help

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-24 13:45:52 UTC
From: WB7TXG
Topic: 1664 Message: 1664

S-meter wants to peg backwards and/or when signals are received very,very low s meter action.

Things done so far"
1. Cleaned all wafer switches with tarnx and used deosit to lube and wash tarnx off - this greatly helped receiver in all aspects!

2. Removed all the tubes and replaced with spare set

The audio is good and receiver seems to be sensitive when compared to other rigs in the shack.

3. The calibrator signal can be heard on all bands now and I can get about an S3-5 on some of the bands, some a bit lower.

Some of the alignment steps I cant do yet do to lack of test equipment.. I've ordered an RF signal generator, a frequency counter, and picked up a reconditioned VTVM with RF probe - these items are on the way.

I skipped alignment steps on Page 34 of R4B manual (steps 2 thru 6) as I have no 13.6 crystal.

Peaking all of the various band trimmer caps for each band helped quite a bit but still cant get S meter to work right.. It moves up on signals but wants to stay hard to the left.

I do have a fluke meter but dont think it will work regarding measuring tube voltages..

And no - I am not a professional radio service technician. Rather, I am trying to learn without destroying the equipment :)

1665. Re: [DrakeRadio] R4B receiver help

From: Garey Barrell
Topic: 1664 Message: 1665

This comes up every once in a while, but Tarn-X on switch wafers is a _VERY_ bad idea. First of all, the black silver sulphide on the wafers is very soft, and does no harm to the continuity of the switch. If you look closely at a wafer that is blackened, you will see a very fine line of silver showing through, which is where the contact area is. The sulphide is very soft, and is easily displaced by the wiping action of the switch in normal operation. If a switch is unused for a period of time, the sulphide will "grow" back, but merely exercising the switch will restore operation. DeoxIT does help in cleaning and "protecting" the bright silver stripe, and slows the reforming of the sulphide. The other thing about sulphide is that it is "self-limiting", i.e., once it covers the bright silver, it stops "growing". On the other hand, Tarn-X is a chemical that in conjunction with moisture from the air actually corrodes the brass/copper base of the switch parts, and causes considerable damage if not removed entirely. Anyone who has worked on much electronic equipment has seen switches that have been damaged beyond repair by application and incomplete removal of "silver cleaners", both chemical and abrasive. They are for cleaning silverware, NOT for electronic equipment. By the way, DeoxIT is NOT an effective cleaner for silver cleaner residue, FLUSHING the area with a lot of water or alcohol is required to remove it. Bottom line is that silver cleaners have no business in electronic equipment, and cause far more harm than good. If you plan to display your receiver with the bottom off so viewers can see the bright, (non-functional} rotary switch parts, silver cleaners are useful..... Sorry for the rant, but I have seen more than a few switches damaged by silver cleaners that reduced the equipment to a parts unit.

Replacing all the tubes at once is also a bad idea. For one, not all New In Box tubes are actually good 40-50 years down the road. So it's conceivable that by replacing all at once that you have installed bad tube(s), and so discount tubes as a potential problem. This can lead to chasing your tail down a rabbit hole, because you "know" it's not a bad tube!! Much more effective to have a set of spares, and replace suspected problem tubes one at a time to see if any improvement is gained. Most likely your S-Meter problem is the result of a "bad" tube. First of all, there are four versions of the R-4B, each slightly different. So the first goal is to get a copy of the schematic for the unit you have. This can save lots of confusion! The S-Meter circuit is similar in all though, so may not be a problem. The S-Meter is a bridge circuit that compares the current drawn by V2 and V3 against the current drawn by V4 and V5. When these for stages are at "idle" with no signal applied, the bridge is "balanced" and no current flows through the meter. When a signal is applied, these currents change, unbalancing the bridge and causing the meter to read upscale. After a 15 minutes

warm-up, with the Preselector detuned, and with the RF GAIN control full CW, you should be able to adjust the S-Meter to Zero with the ZERO control on the right side of the receiver. Then turning the RF GAIN control full CCW, the S-Meter should read 60 dB over S-9. or full scale, adjusting if necessary by turning the pot R40, the blue trim-pot near the center of the chassis bottom. If these two conditions cannot be met, one or more of the four tubes is bad, and/or a resistor in the circuit has changed value. Most common problem is with the 12BA6 tubes in V4/V5, which become "gassy", causing the grid to "lose control" of the plate current. This particular problem tends to get worse as the tube heats up, causing the S-Meter reading to "drift" over time from turn-on. Even "new" tubes can be "gassy", and it is sometimes necessary to try two or three before finding a "good" one.

Unless a receiver has been "fixed" improperly, or has a defective tube or component, alignment can be completed with no additional test equipment. The Calibrator signal replaces the signal generator, and the S-Meter replaces an output indicator. The IF stages are very broad, and seldom require adjustment. Likewise the "filter match" alignment doesn't change by itself! This is the wrapped wires around the filter match transformer pins, and is best left alone unless it has been obviously "fixed" by someone else. It is a bit tricky to do, especially the first few times you do it, and is just not necessary. 95% of alignment problems are associated with the trimmer caps in the RF and INJ circuits. Merely setting the Preselector control as described by measuring the slug height, and peaking the associated trimmers at the specified frequencies will result in a good performing receiver. Use an insulated adjustment tool, and be especially careful to NOT short the trimmer to the chassis, even for a moment.

For your receiver, I would suggest making voltage and resistance measurements around V2, V3, V4 and V5 and investigate any deviation of more than 15-20%. Your Fluke meter should work just fine. Drake didn't always update the Voltage and Resistance tables when versions changed, so if a particular measurement is way off, check the correct schematic to see if the actual reading "makes sense". If these readings are all OK, then try substituting V2, V3, V4 and V5, ONE at a time, noting the S-Meter operation with each change.

A properly operating receiver should read S-9 plus on the Calibrator signal on all bands. Each harmonic is a little different, so if one reads low, try one or more either side.

Let us know if we can help!

1666. Drake 2B S-Meter Calibration/AVC

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2008-12-25 15:35:23 UTC
From: py2xb
Topic: 1666 Message: 1666

Hello. Merry Xmas to all of you.

Still need some help on my 2-B that still on the bench.

I have calibrated the S-Meter using the manual instructions. The radio was turned on for a long time BTW. The process was straightforward. Too bad that even a 15Mohm voltmeter shunts the AVC line. The manual's procedure takes this in account.

Later I realized that when I turned the radio on again, the S-meter does not go to S1 right away. This is what happens: When I turn on the 2-B, the S-meter goes to around S9+10 and then goes down to S8. Then it starts a process that takes around 10 minutes until it goes to S1 (to the calibrated position).

I have verified the whole AVC circuit (resistors and capacitors). The AVC is working apparently well. It acts, as it should. I have also replaced the 6BF6 (AVC amplifier). Nothing changes this behavior.

I also realized that there is a slight change on the S meter S1 when the AVC is set from fast to slow (or vice versa). On Slow the S meter goes closer to S2.

When the "resting process" is happening, I've tried to monitor the AVC2 voltage with the VTVM or with an oscilloscope, but the measurement instrument's load difficult the task and even changes the S-meter position.

I do not think it has to do with heat because sometimes I turn the receiver off for few minutes and turn it on and all happens once again.

I am wondering if someone have experimented that and/or has any tip.

Thanks and regards Fred

I'll mimic what others have stated- and it's true. The Dake meters do not begin to respond to peaks (the rigs meter or the W-4). If you have a PEP wattmeter you'll get a much better idea of what the rig is doing. I use an EV-664 with excellent audio reports- AM and SSB.

Grant,

The stock crystal for the 20m band is 18.0 MHz. A 10.5 MHz crystal can be used if it is inserted in socket "C". See your manual for details. I happen to have an 18.0 MHz Drake 2B crystal in my parts stash. It is a new replacement part from International Crystal. I acquired it in a box-lot of crystals at a hamfest a while back. If you need it, give me your address and I'll send it to you.

From: Wiley Clarkson
Topic: 1677 Message: 1680

My T-4XC is doing something similar but not quite the same. When I key up, I see momentary output but the relay will not stay closed. I can hold the key down and the carrier will be momentary and then it switches back to receive. I can also hear the tone but only if the delay is turned to max and then it still won't hold in Xmt. I haven't been able to keep it in xmt long enough to actually see what my CW output is. I'm going to try a mod suggested by Drake for foot switch control of the xmt/rcv in CW and then see what it does.

I don't do much CW but I was able to purchase a Vibroplex Original on EBAY at a really good price a few weeks ago and now have the "bug" to do a little CW.

From: Garey Barrell
Topic: 1677 Message: 1681

Wiley -

Make sure your ANTI-VOX isn't turned up too far.

IF the transmitter works OK in TUNE mode, the problem is in the VOX circuitry. There is a diode/cap network that sends a pulse at the beginning of each VOX trip to "yank" the relay in so you don't lose the first syllable or dit. That pulse is what causes your "momentary" transmit. The pulse is very short, and so on CW the sidetone is rectified and integrated to KEEP the relay closed during the transmission. IF the sidetone is NOT applied to the VOX as it should be, the relay drops out almost immediately.

One difference between SSB and CW is that on CW the sidetone is KEYED by biasing diode CR15 on or off. If this diode shorts, the symptom will be as you describe. Also, the positive voltage to bias this diode OFF, allowing the sidetone to pass and hold the VOX in, is applied through R84 and R85, each a 22M resistor. These resistors sometimes go up in resistance with age, and the result is insufficient reverse bias to turn the diode OFF.

There are other possibilities, including Bias supply problems, C107, etc., but usually it's the diode or resistors above.

Congratulations on all you guys doing the AC-4 upgrade. When you've done enough of them, you will be able to do them in about 45 min. That's about what it takes me now, and I've done a few. All worked the first time. I'm still having trouble with the Harbach mod for the SB-200. I'm beginning to believe it's the 572B tubes. When I try to load it, my HV drops over 800 volts, and I read a negative grid current. I'll keep at this one, cuz I got way too much cash tied up in it. LOL And, yes I've checked the 33 ohm grid resistors, so don't try and tell me they are bad.

Happy New Year es 73 to all,

Hi Floyd,
I just saw your post regarding wierd AGC pproblems on your R-7.
I had similar problems. No AGC in any setting except SLOW.
I checked everything and finally traced it to the pushbuttons too. I
sprayed them with DeOxit and everything has been fine since.
The FAST setting is still too fast, but others have seen the same, so
I am guessing this is as designed.

Garey,

Thanks for the tip. I'll take a look at it in a day or two and try a little readjustment. I looked at the schematic several days ago and had the thought cross my mind as an "I wonder if ....." but I saw the foot switch mod at the same time and thought that it might be handy, along with being a go around to the problem and never returned to thinking about what you said.

1685. What Drake is better?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-03 17:41:10 UTC
From: Enrique Fernandez García
Topic: 826 Message: 1685

Happy New Year 2009 to the group!

I would like some advice in which receiver to buy since I have seen you are real experts on Drake receivers.

I am am mainly interested in AM stations, tropical bands, 49mb and Medium Wave stations, not SSB or CW.

I have already got a Drake R8B and I amnot very happy with it because it is very noisy in these bands,noise floor?
I have read in some reviews that the Drake R7A it is very good in these bands, I would like to buy also one R4B , it is said that it is very good too but the only inconvenient I find it is the crystals.
My questions are:
Is it worth buying the R7A or the R4b having the r8b? Will I listen the same stations with more clarity?

Or is it better to buy a better receceiver such as A Racal 17L or a Hammarlund Hq180a?

Any opinion is very wellcomed. Thank you very much

Thanks. Yes, I know about the noise and antennas.

I have got a Wellbrook 1530+ loop antenna, it is very quiet, but in tropical and 49mb with the Drake it is noisy. However, with another receiver, AOR AR 5000, it works with less noise.
I think that the Drake pick up or it has more noise floor.

I have found the R8B to be susceptible to noise pickup from the AC power line. I found substantial improvement by adding a power line filter.

1690. AC4R upgrade

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-04 03:47:50 UTC
From: Wiley Clarkson
Topic: 1690 Message: 1690

Well, I guess it was a good thing ordering that upgrade when I did, which I started working on this morning. I had my T-4XC on my old AC3 PS and was going to try some adjustment of the antitrip on CW to see if it helped the short relay duration. I pulled the transmitter out from its normal position, felt some extra heat, and looked down into it. The finals were bright orange and the radio was showing output when it shouldn't. Guess I lost the bias voltage and it just picked that particular time to do it!

Regarding the AC4R upgrade: the only thing I have found so far that i don't like is the instruction sheets are not quite what I expected to go with the PCB, although they are adequate. They are a little vague in a few places so far and a color photo set down loadable from their web site would be helpful. For some one less experienced in electronics, they could be a little confussing. I'm about 1/3rd the way through the mod and have about 30 minutes involved so far.

I have put some ferrite cores clipped onto the cable but no improvement at all.
I will purchase an AC filter then. I have been reading some reviews on eham and I.C.E./EMI filter,400 series are quite good for SW listening.
Thanks Bob.

1693. Re: AC4R upgrade

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-04 18:44:36 UTC
From: w5rkl
Topic: 1690 Message: 1693

Yep, Wiley, a failed bias supply can create some pretty interesting things. It's surprising that quite a few hams don't realize this can happen, not only with Drake gear but other manufactured ham gear as well.

The exact same thing happened recently with a few Kenwood hybrid owners I know. One of the guys didn't know it was happening until he pressed the PTT button during a QSO and the IP current meter slammed full scale then the fuse blew. Removing the final tubes and checking the bias supply showed "zero bias voltage", a shorted bias filter capacitor, and a blown bias diode. This, along other supply failures, is why I do not rejuvenate or reform old worn and dried up filter capacitors.

I guess I'll be ordering another upgrade before too long for my AC3 PS. I'm not much in to trying to save an old PS with old parts when something alot better is available. I just finished the board installation but haven't had time to test it yet. Probably tomorrow if I'm not working extra hours! I'm off to the salt mine as soon as I hit Send.

From: Mike-K5VSE
Topic: 1696 Message: 1697

I had the same problem a couple of years ago. I replaced both of them at the same time, and within 3 months another went out. I finally did the power supply upgrade and replaced both the resistors one more time. Since then, I've not had a problem. Also, with the upgrade, the regulation is much better. Fully loaded, the HV only drops about 200 volts. I have to assume the caps in the original Drake supply were getting a little dried out. I also noticed the heat build up in the power supply is not anywhere near what it was, indicating the caps were going south.

Just my personal thoughts.

I'd like to extend a thanks to all the members on this board. The information contained in all the posts is worth its weight in gold!

A special thanks to K4OAH - Garey for all his help via emails getting my old R4B and TX4B back up and running. The receiver still needs a tad bit of work and troubleshooting but I'll leave well enough alone for now.

Garey's knowledge, patience, and help significantly aided my efforts with the R4B!

Lessons learned:
1. Dont change all the tubes at once and assume the new ones are good - one of mine wasn't (V2 - 6HS6) and I had a weak (V7 -6EH5).. these sure caused great grief with the S meter and AVC..

2. Don't use TARNX - I spent hours re-cleaning the bandswitches with alcohol to get the stuff off - I then sparingly used DEOXIT and put a light coating on the wafers

3. Make sure you are using the right schematic for your receiver - I had one that did not match my late model receiver - makes it hard to troubleshoot the circuits!

Many thanks again to all the folks that take the time, effort, and energy to post valuable information regarding the Drake line of equipment.

I hope that I can continue to learn from this forum and perhaps even contribute something that is useful for another person.

Grant

Before you replace the cristal try to replace the 6U8 Tube by another one or by a 6EA8. I had a similar problem with a "non working 10m crystal". All crystals worked but the 10m one.
Tube replacement fixed the problem

HNY

When I lost the bias voltage the other day, I was able to shut the transmitter off prior to a total destruction of the finals but it did weaken them and lower the output by about 40%. Anyone know a good retail source for final amp tubes that are matched and what tube brands work the best?

BTW, the AC4 upgrade I did went smoothly and took less than 2 hours. The AC3 ps that I lost the bias on will be the next upgrade and I'll bet it doesn't go as fast!

Try RF Parts in Oceanside, or Carlsbad, CA. They still have a pretty good selection of many of the obsolete tubes, if my memory serves me correctly. Otherwise I have little doubt that there are those here, who have them for sale, too.

Hi

Been watching this. What are the general prices in the U.S. for these tubes? In the UK they seem to run at around GBP£39 each which puts them around US$90 for a pair.

Somewhere on this reflector I am sure I read that the 6GJ5 was a good substitute and half the price.I may have got that wrong it could have been 6JG5. Mike or Gary would know.

1710. VERY dirty drake B line

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-12 21:18:50 UTC
From: n8cep
Topic: 1710 Message: 1710

I have an r-4b and t-4xb which I was going to try to clean up
(the chassis are REALLY dirty). I have been a bit afraid to
test the transmitter and power supply due to their condition.
The fronts are pretty good but one problem is the dial ring
on the r-4b is faded to a dark yellow on one end of the dial.
I am pretty sure there is no way to solve this. I think I may
use these for parts and look for another pair in better shape.
(cleaning these up is a bit beyond my abilities. Can anyone help?)

If anyone has an B-line for sale, contact me. It doesn't
have to be perfect but should be fair cosmetically and darn good
electrically. I have a rebuild kit for the power supply. I just
missed out on a r-4b listed on eHam.

hello to all , i am happy to be a member of the group.
i just received a tr-4x transmitter this past week end along with the power supply, it has not been used since 1976, was put in a cabinet and sat there untill i purchased it last week end,
my question is, where should i start on bringing this set up back to life, where do i began, i am not going to power it up untill i replace the filter caps in the power supply but where do i begin with the transmitter before i apply power to it,
i know a little about radios, mostly tinkerer and would apreciate any information i can use,,, thanks in advance,,,,,,,,,,,,,,, jim

From: w5rkl
Topic: 1686 Message: 1717

Any AC3 or AC4 will power a T4<any> transmitter or TR3/4<any> transceiver.

Most AC3 and AC4 power supplies contain original components, diodes, resistors, and filter capacitors. These components age and with capacitors, the internal leakage current becomes high with age. A capacitor with a high leakage current can eventually result in an open or shorted capacitor which can lead to hum or, worse yet, failure in the supply. If the failure is in the bias supply, the final tubes are affected, even in standby.

The bias supply provides normal operating bias voltage to the transmitter plus it cuts the final tubes off in standby. A bias supply that produces zero bias voltage, even in standby, can result in damage to the final tubes!

So, don't take the chance, replace those capacitors, resistors, and diodes, with new components or install Mike Bryce's AC4 upgrade kit from "The Heathkit Shop". Your AC3 or AC4 and transmitter/transceiver will thank you for it.

As always, it is your choice to make whether to update the supply with new components/upgrade kit, or simply operate the supply as is. You should ask yourself which is more important, operating the transmitter/transceiver with an aging supply that can, if it fails, take out the final tubes plus possible damage to other circuits/components or not operate the AC3/AC4 supply with the transmitter/transceiver until the supply is upgraded? Again, it is your choice which route you take. I'm only providing information so you can make a decision regarding your AC3 or AC4 supply in hopes of preventing damage to your supply, transmitter, or transceiver, nothing more!

1718. Cleaning Chemicals

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-15 15:05:54 UTC
From: John E. Beck
Topic: 1718 Message: 1718

Greetings from a cold Kansas City.

First of all, thanks to all on the board who have contributed from their knowledge and experience. It has no doubt saved us from a variety of mis-steps.

We just acquired a beautiful set of Drake twins (R4B and T4XB) and are in the process of bringing them back to their full potential. The first general cleaning and initial power tests went very well. This set was from an estate and appears to have the original Sylvania tubes.

I read in previous posts that Deoxit has been recommended as a switch cleaner and Tarnix is a "no-no". Has anyone had any experience using some of the other brands of cleaner-lubricants, such as MG Chemical Contact Cleaner?

Thank you in advance for your insight.

73,
John (WB0RXL) & Katherine (AA0IS)

Mike

Been following this discourse and very interested. My AC-4 works fine but it is an original and won't last forever. Have tried the Heathkit shop for AC4R re shipping to UK but no reply as yet. Is there any particular reason why changing the caps wouldn't ensure a longer life for the AC-4?- or, if you change one part of the cct making it stronger are you imposing stress on the older parts - diodes etc.?

Regards

Vic,

Power supply stress is based on the current demand placed on the supply by the circuit the supply feeds. In the case of a failed bias supply, for example, the HV supply is put under a lot of stress simply because the high current flowing in the final tubes due to the absence of the bias voltage from the bias supply.

Replacing power supply component can allow the AC4 supply to continue operating for longer periods of time. Failures in supplies, if they are not overstessed by abusing operators, will last quite a long time. Most failures occur due to age and, in some instances, abuse by operators. Abuse can be classified as pushing final tubes for those last few extra watts which puts a lot of stress on the HV supply, for example. The transformer HV windings are also stressed due to the increase current demand placed on it by pushing the final tubes at or over their limits. So, to answer your question, it depends on what circuit is placing the high demand and to what supplies. In general, the AC4 supply can be overstressed by just about anything.

Whether you choose to use individual components or the AC4 upgrade kit it your choice. I will tell you, from first hand experience, to upgrade an AC3 or AC4 can be quite a task using individual capacitors. I don't recommend it as I considered doing it that way. However, I have since changed my mind after a through inspection and rethinking of updating my AC4 supply. The AC4 upgrade kit is the way to go. I do not recommend NOS capacitors since NOS caps are just as old as the ones you are replacing. I do not rejuvinate or reform capacitors. There are those who do but I don't. The question you should ask yourself is, do I want to do it right the first time or will I have to go back in and redo it again later? Again, the choice is yours to make.

John,

I do not have any experience with the cleaning chemicals you mentioned. I have used Simple Green followed with water to clean cabinets, front panels, and knobs. Simple Green will remove just about anything, with a few limitations, but what ever is cleaned with Simple Green must be washed in water after-wards to remove the residue left by Simple Green.

I use Windex on glass to remove finger prints and grease. I also use Armor-all after cleaning front panels and cabinets. It makes the cabinets looks very nice. However, do not over do it with Armor-all as it will leave a greasy feeling. Just a very light coating is all that is needed.

DeoXit is an excellent contact cleaner. Use only small amounts on switches and pots. Follow it with canned air to remove the excess DeoXit. Canned air also helps remove anything left behind by the DeoXit cleaning process. A little goes a long way so use it sparingly.

Read the cautions on all cleaning chemicals. Some chemicals can remove lettering and paint. When using contact cleaner, read the cautions on the can. Contact cleaner is "flammable" and it only takes a small spark to ignite it. Do not soak switches and/or pots. Again, a little goes a long way.

Just use caution and read the cleaner's label before using. If there's any doubt, don't use it!! Mild soap and warm water does wonders in cleaning!!

Mike

Thanks for very detailed and informative info.

I think you final sentence sums it up which basically equates to either do it right the first time or risk having to do it again - and perhaps the rig as well!!

Many thanks

Vic

I don't recommend DeOxit for pots. It is not a lubricant. I usually
flush the pot body with alchohol, then follow it up with a very sparing
application of a lubricated tuner cleaner to keep the wiper lubricated.

Or you can use this:

http://store.caig.com/s.nl/sc.2/category.293/.f

For switches, I use the DeOxit with the needle applicator:

http://store.caig.com/s.nl/it.A/id.1703/.f?sc=2&category=188

Spray application is not good for rotary switches and surrounding
components. This puts it exactly where I want it, and nowhere else.

Jim -

Absolutely! I've been using this stuff since it was called CaiLube MCL. Cleans very well, and makes a pot feel like new. Also great for slide switches.

D100L with the needle for the switches.

Have really enjoyed my TR-7. Thinking of getting a TR4? to begin a collection. Main use would be SSB. I vaguely remember tuning up my Heathkit DX-35 a few years back (like 45yrs) had no antenna tuner back then and am sure the antennas were not resonant. Downloaded the manual. In looking at the tune up procedure, not sure where and how to include the antenna tuner on my Doublet which of course is not resonant.
Any clarification would be of great assistance. Any comments upon the various TR4 models would also be welcome.

The antenna tuner always connects between the transmitter/transceiver
and the antenna.

I understand the location of the tuner, unclear do I tune the xmtr
before tuning the ant then tune the xmtr agn then the tuner agn. Do I
use my TR-7 to tune the ant then switch to the TR4 so that it tunes
into a tuned antenna?

Crit -

The answer here is that the tuner does NOT "tune" the antenna, it merely converts whatever the antenna IS to what the transmitter WANTS to see, i.e., 50 ohms with no reactive component. It doesn't do this perfectly in all cases, which is why you still see "some" SWR even after the tuner has been properly adjusted.

It's easiest to use the TR-7 to adjust the tuner, since the TR-7 will just cut back it's power output automatically while the adjustments are being made until it is seeing what it wants. Often you can then record the dial settings of the tuner for that particular frequency and next time get it "close enough" by setting the dials to those points.

Anyway, once the tuner is adjusted, you can then load the TR-4 into the tuner in the normal manner. You might then "touch up" the adjustments on the tuner for the best possible match.

Alternatively, you "could" turn up the XMTR GAIN control on the TR-4 just enough to be able to dip the PLATE control, which will give you enough output to be able to adjust the tuner for minimum SWR, then increase to full power and again "touch up" the tuner for best match.

I myself adjust radio and antenna tuner to max noise, switch to dummy and tune radio, switch to antenna and adjust tuner to lowest swr and touch up the radio for max output.
Hope this makes sence,
Tim

Tnx Garey.
The tuner is actually an autotuner so cannot tune for max noise 1st.
What you said makes great sense ... Either low power from TR-7 to
trigger the autotuner and then tune the TR4 or "could" turn up the
XMTR GAIN control on the TR-4 just enough to be able to be able to dip the PLATE
control, which will give me enough output to be able to adjust the
tuner for minimum SWR, then increase to full power and again "touch
up" the tuner. Your emphasis on "could" leads me to think you believe
the first method is safer.

Crit -

You got the general idea!

I use an LDG AT-200 Pro auto tuner. It has 16000 memory "locations", so I just went through with my TR-7 to all the frequencies I use, and let it set up the tuner. It only takes a second or two for the vast majority of sets, so just turn the dial, key the TR-7, clickity-click and it's done. Then when I connect the TR-4C, the first little bit of RF makes the fractional click it takes once a frequency range is set, and I can tune the TR-4C to full power. If I happen to go someplace I haven't been before, I just get a few clicks and it's done.

ANY tube amplifier is unhappy if it's not "dipped" to resonance. Sweep tubes are particularly susceptible to off-resonance operation because of their very high perveance (very high plate current at relatively low plate voltages) which is what made them so popular! As long as they are dipped, the few seconds it takes for an autotuner is not going to hurt anything. If it's a manual tuner, and you have to twiddle three dials for five minutes to get it set, THEN I'd be concerned.

From: jch39_99
Topic: 1735 Message: 1735

Good evening folks. Bare with me.
In anticipation of getting a TR4, I am reviewing the "Tune-up" procedures in the manual. Been awhile since I had a tube rig. Think I follow that okay. At the end says the plate current should end up between 0.380 and 0.500 amps.

However, I found a webpage stating that in order to be in compliance with Section 97.73 of FCC regs the plate current should not exceed 0.350 amps. when tuning the TR3/4 especially for 80,40 and 15 mtrs. Which is correct?

Additionally, there is mention of adjusting the bias on AC-4. I am assuming this is done initially and then left alone.

Yeah, the reduced plate current was specified when the FCC came out with their new "Purity of Emissions" specifications. The TR-4(any) transmitters will exceed the 3rd order distortion specification if loaded much above 0.350A on those three bands. Generally not a significant problem, assuming you're not driving a linear amp, which further exacerbates the problem. Of no concern for CW operation. On the positive side, the lower plate current won't make a discernable difference at the other end, and your Final tubes will last longer!

The Bias adjustment is done once at installation, and should not require adjustment again until the Final tubes are replaced.

1738. Orlando Hamcation, February 12, 13, 14, 15

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-23 13:06:42 UTC
From: Ken Simpson, W8EK
Topic: 1738 Message: 1738

Information about the Orlando Hamcation, February 12, 13, 14, 15:

If you have never been to the Orlando Hamcation, you need to think about attending. It is now the second largest hamfest in the country, fast approaching the size of Dayton. While Hamcation is technically Friday, Saturday, and Sunday, the fun really gets started with most tailgaters moving in on Thursday. It seems you can find most anything you would want with 100's of vendors -- maybe even approaching 1000. Everything from the most ancient boatanchor to the most modern rig will be there.

In addition, Florida is the place to be in February, as opposed to the "Cold North". There are plenty of activities for the family as well, in the central Florida area.

Swap tables at the Orlando Hamcation are still available at the present time.

If you would like a table in the swap building, you can contact Mort, WA2ARS, or Roberta at hamcation@..., and make your reservation. Remember if it is cold or rainy outside in the tailgate section, it will be warm and dry inside the swap building.

More information is available at
http://www.hamcation.com/

See you there.

Thanks.

1739. R4B vs R4C

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-23 15:22:27 UTC
From: jch39_99
Topic: 1739 Message: 1739

It seems that most sources talk about the R4B being a better "deal" than the R4C because it comes complete. The basic R4C does not fair well in the Sherwood Tests. However, a moded out R4C has incredible numbers. I may have missed it, but where would the R4B stand in the Sherwood table? Just curious.

Crit -

My opinion, for what it's worth ... Do you want a receiver to use for day-to-day hamming, or do you want to "compare numbers"?

The Sherwood numbers are almost entirely based on the ability to reject a strong unwanted signal that is very close to a weak wanted signal. They give no consideration to the "sound" of the signals you hear in the speaker, the ergonomics of the panel, or anything else. Granted this is extremely important for contesting, especially on the low bands where wall-to-wall 50 over 9 signals are prevalent. This capability can also be of help in picking out a weak DX signal buried in the "DX Cops" screaming "Up Up Up Lid" etc. But for just getting on the air and talking to a friend or meeting someone new, it just isn't all that important, especially in today's uncrowded bands.

I suspect the R-4B would fall somewhere around the stock R-4C, perhaps a little lower. The "big deal" for Sherwood is the ability to reject a signal that is two kHz away, and the "roofing filter" in the R-4B is eight kHz wide, so right away we're in trouble according to Sherwood! Keep in mind that the "standard" test when the B was designed was 20 kHz, NOT 2 kHz. The B has a little more selectivity from the PRESELECTOR control, but it's also broad by Sherwood standards. Then you get into the IF, where the Passband Tuner has a shape factor (width of the filter at the "top" vs width 60 dB down) of about 4 - 5 and an "ultimate" band stop of about 70 dB, compared to the shape factor of a crystal filter of a little less than 2 and ultimate of about 100 dB. So yeah, you're gonna hear a LOT more "stuff" around your desired station with the "B" than you will with a K3! There are going to be more times that your "desired" signal is obliterated by some clown 5 kHz away running 5 kW to a six element beam. There will be many more times that you'll "hear" the other guy, but he'll be knocked down enough that you can still COMMUNICATE with your guy.

So..... I started out with a receiver that covered the entire Novice band of 50 kHz in approximately 1/8" of dial, and about a half turn of the knob, with a bandwidth of about 30 kHz. This was at the peak of the best sunspot peak ever, and the band was literally wall-to-wall with signals, all at about the same level. I developed a pretty good ability to pick out a particular signal with the filter between my ears, along with a "safe-cracker's" touch on the tuning knob, so forgive me if I am a little less impressed with the importance of the Sherwood numbers!! :-)

Tnx Garey for another well thought out posting (worth alot).
I have a FT897 and w/ its bolt on ant tuner and built in batteries it
is a great threw it in the case take anywhere DC to daylight rig, but
sure isn't a contest radio. Each radio has its niche.
I was just wondering if RL Drake when it switched from "included in
standard radio" to many options available, did they also change their
how the radio works in the real world philosophy as well.
And apparently they did not. Thanks.

Crit -

I think the change was the result of operators who learned their CW on code oscillators rather than listening on the air! Many could copy code pretty well, as long as there was ONE signal in the phones. They were not nearly as tolerant of ANY other sound, especially a different cw signal... :-)

Of course the fact that crystal filters in the 3 - 9 MHz range were dropping in price didn't hurt.

By the way, phase shifts along the steep slope of crystal filters results in some undesirable distortion artifacts in the AVC system.

1744. R-4 - 12BZ6 PROBLEM

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-23 21:01:09 UTC
From: tnham63
Topic: 1744 Message: 1744

I have been trying to aquire a spare 12BZ6 for my R-4 and
here is what I have found.
I have tried 4 NOS tubes from 2 different suppliers and all do
not work. They produce a S 6 on the S meter and almost no
signals. Even the Xtal Calibrator barely moves the S meter
from is S 6 perch.. I have a 12BZ6 in the R-4 that works fine
and I am trying to figure out what the trouble might be?
One supplier (who has sold me tubes in the past that work fine)
claims he has sold these to other Drake users with no problem and
that they check great in his tube checkers and I have no reason
not to believe him. He has just sent me two
more replacements and they do the same thing.
I can't believe these are all bad tubes, but I don't know what
to check next or why this would be happening......
Any ideas ????
Thanks.

Wink -

Strange indeed..... What brand(s) are the new tubes? You sure your R-4 doesn't have a 6BZ6 in it and been rewired for such?? I know of at least two R-4s out "in the wild" that "I" modified for a 6BZ6 due to the cost differential of the 12BZ6 even back in the 60's....

Only other thing that comes to mind is have you tried peaking the alignment trimmer with the new tube in place? Would not think there would be that much capacity variation among "known" brands.

Don't know if it's worth anything but I had a problem with a tube which replacements didn't fix. Turned out to be a duff tube socket. Fixed that and they all worked.

Gary
The new tubes were RCA and Sylvania. Yes, the tube in it now
is a 12BZ6 for sure, but I don't know the manufacturer
as it is rubbed off, but it works.
I'm stumped as to what to do if this tube fails...

Well it doesn't sound like anything "logical". :-) It's certainly not reasonable to think that FOUR NOS tubes of reliable brands are all bad.

Vic suggested a bad socket. Are the pins on the "old" tube straight? Perhaps one pin is slanted enough to mate with a sprung socket that a new straight pin misses?

Since we don't know the brand of the old tube, perhaps IT is the weird one with a bent element inside or some other anomaly that has changed the capacitance and therefore the alignment adjustment is "off" to compensate for a "bad" tube.

I'd say put in one of the new tubes, and touch up the input and output trimmers on one band to see if it's an alignment thing. Then check the element voltages with the old and then a new tube in place. IF not, then time for bright lights and insulated sticks to poke around and find what's changing. My guess would be a bad solder joint or cracked AVC resistor on the Grid circuit.

Let us know!!

1749. MN 2000 Tuner Knobs Loose, Knobs Tight

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-24 19:03:44 UTC
From: Les WB6ORZ
Topic: 1749 Message: 1749

Say, I'd appreciate the collective wisdom: The band switch knob on my MN 2000 gets loose on it's shaft every few months are so, and this requires re-tightening the slotted set screw which retains the knob. Of course, not too difficult, but a hassle, and I'd like to know a way to prevent it, if possible.
Seems like there's an awful lot of torque on that knob. Would opening up the case and lubing and/or adjusting the bandswitch help, and if so at what points? In another approach, where a set screw loosened in it's own knob, a friend has had good results using Teflon plumbers tape wrapped around the set screw, which seems to keep the set screw tight. I'm not sure my knob is the problem, although maybe it is and also maybe the control is just too hard to turn. Maybe both at this point?
One more : while the 2 other knobs (Reactive and Resistive) stay tight, using them is tricky, as there is not that much vernier, so the slightest turn of the wrist throws the SWR a bit too much this way or that, and it's kind of tricky to get just right. I saw one other approach to this in a mod which a guy used...he installed vernier controls, but I'd like to stay stock. Can these controls be cleaned, lubed, and/or adjusted inside to loosen up their travel?
Thanks in advance!
(((((73)))))

The manual should have a voltage & resistance chart you get right off the tube socket and referenced to ground. So should be easy to get to. Make sure you follow the notes of where the switches are and if power is on or off. And CAUTION HIGH VOLTAGE!!!!!!!!!!

The problem can also be in the preceding or following stages so I would measure them as well. I have heard that some tubes when replaced the radio may need to be re tuned. So again if you don't have a manual get one. If all that checks good you may want to consider looking at the caps in that circuit. They as you know are much harder to trouble shoot but can cause real problems.

Good luck I feel your pain!!!!

Wink -

OK. You're seeing parallel paths. Do you have a manual??????

Try measuring from each pin to ground as ...

1 - 4.4M
2 - 150

5 - 8.5k
6 - 2.6k

Also reverse your ohmmeter leads on each reading as well, to see if
there is any difference.

See what you get here before replacing. Those ARE hard to get to.

73, Garey - K4OAH

And if you have a few extra $ to spend I'd highly recommend the CD service manual that Garey has put together! It will make life much easier trying to find component location, etc..

--- In DrakeRadio@yahoogroups.com, Michael Shelly <wb2kki@...> wrote:
>
> The manual should have a voltage & resistance chart you get right off the tube socket and referenced to ground. So should be easy to get to. Make sure you follow the notes of where the switches are and if power is on or off. And CAUTION HIGH VOLTAGE!!!!!!!!!!
>
> The problem can also be in the preceding or following stages so I would measure them as well. I have heard that some tubes when replaced the radio may need to be re tuned. So again if you don't have a manual get one. If all that checks good you may want to consider looking at the caps in that circuit. They as you know are much harder to trouble shoot but can cause real problems.

Garey -

Ok Here is what I got each pin to ground

1- 1.1m reverse 1.1m
2- 166 reverse 166

5- 7.2k reverse 8.6k
6- 8.3k reverse 8.3k

I have a manual copy.
What do you think now?

1755. Drake Net on 40 meters?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-25 23:24:23 UTC
From: Dan Galligan
Topic: 1755 Message: 1755

Can someone please give me the info on the Drake net, held on 40
Meters? I know about the Tuesday night 75 meter net, and I had once
written down the info on the Sunday 40 meter net, but cannot locate
the information.
Thanks

1759. Re: [DrakeRadio] Re: R-4 - 12BZ6 PROBLEM

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-26 20:25:52 UTC
From: Garey Barrell
Topic: 1744 Message: 1759

Wink -

OK. Pins 2 and 5 look to be ok.

There may be a problem on the AVC line. I wonder about C15, a leaky cap could be a problem here.

The resistance of R4 is suspect, but typically high value resistors go UP in value rather than down.

Voltage checks should show:

1 - -1.1V
2 - 1.66V

5 - 153V
6 - 129V

Be sure RF GAIN control is full CW and AVC Slow is selected.

It might be interesting to measure these voltages with both an "old" and "new" tube in place.

Work in this area is difficult, it's best to slide the bandswitch shaft back by removing the knob, then removing the two screws in the back panel and CAREFULLY pull the shaft back to clear the area. I pull the shaft completely out, since if the portion extending out the back is hit or otherwise moved it can damage the switch wafers. When re-installing the shaft be sure the shaft flats are aligned with EACH wafer as you slide it back in. A digital photo of each wafer showing its correct orientation BEFORE removing the shaft is a good idea.

You can disconnect one end of either R1 or R2 to measure those two resistors accurately.

Interesting problem!

OK Garey -- Thanks the help - It will probably be Saturday
before I tackle this when I have more time.
Will let you know what I find.

1761. TR4CWrit output issue.

Yahoo group: DrakeRadio (2006 — 2011)

From: jch39_99
Topic: 1761 Message: 1761

Bit by the Drake bug.
Picked up a pretty TR4CWrit off eBay.
RX sounds great. S meter is stingy.
Powered up last night. Set the bias. All okay.
Tuned it up per manual ... okay plate amps = 0.35 as recommended.
Power out is low on CW and SSB (60 and 80 peak respectively).
Here is the kicker. On CW if I click in the 500hz filter
then transmit, the power is only 1 watt out.
Now, I hope to diagnose and fix the problems (if not too complicated).
I have been a ham for many years, built and fixed a few things; but I
admit I am not the brightest electronic bulb in the pack.
Pse make any suggestions "easy" to understand.
Tnx/73
Crit/K4BXN

A big thanks to Jeff Covelli (wa8saj) for the suggestion of adjusting C130 on the top rear of the chassis for equal backgrnd hiss when switching from one side band to the other. Worked like charm. Nearly equal (as it should be) power out on CW whether the 500 hz filter is inline or not.
Tnx Jeff ... maybe that is why he is so well respected in the Drake community.

1763. Re: R-4 - 12BZ6 PROBLEM/ UPDATE

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-31 16:17:26 UTC
From: tnham63
Topic: 1744 Message: 1763

OK Garey - Here is what I got.
I replaced R4,R1,R2, and C15. R4 measured 2.1m - R1 4.2k - and R2
19k. I also checked the voltages before and after as you suggested.
Old 12BZ6 Before After
Pin1 - 2.63v 2.70
Pin2 - 3.40v 3.64v
Pin5 - 129v 130v
Pin6 - 112v 122v

NOS 12BZ6 Before After
Pin1 - 1.43v 1.45v
Pin2 - 1.71v 1.80v
Pin5 - 139v 150v
Pin6 - 122v 131v
I agree the NOS tube checks better, but it does not work. You plug it
in and the S-meter goes to S7 and stays there. Just about the same as
pulling out the tube results. But the old Tube works !!!!
I don't get it or know what to check next. Any ideas>

1764. Drake items FS

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-01-31 17:12:45 UTC
From: Ken Simpson, W8EK
Topic: 1764 Message: 1764

Drake items for sale:

Drake hand microphone
This is like the hand mic that came with the Drake TR-72, TR-22 C, TR-33 C, and others. It has the standard 4 pin plug wired for Drake/Kenwood, and is a 500 ohm mic. Of course it could be used on an HF rig as well as a 2 m rig. It looks great and works fine. $30

Drake 1525 EM Touchtone DTMF Microphone
This is the mic that was used to add a touchtone pad to many rigs in the 70s and 80s. It is a normal hand mic from the front, but has a touchtone pad on the back. Four pin mic plug. This particular unit has been used, but is in good shape and includes paper work. $38

Drake TV-1000-LP Low pass filter
This is the filter that is in the copper case, and may also be used on the low end of six meters, as well as HF. It is a 50 ohm filter and is good for 1000 W AM below 30 MHz (which would be over 3000 Watts PEP SSB), and about 200 W up to 52 MHz. With paper work for $30

Drake TV-3300-LP Low Pass Filter
This is a modern low pass filter to go between your transmitter and antenna, and has been optimized to have more attenuation in the 40 MHz region, where many TVs have their IF. It is good for 1000 Watts "average" according to the manual, and has over 80 db attenuation at 41 MHz. This one looks great, and includes the paper work. $30

Case for Drake TR-33 C
This is the black case that fits the Drake TR-33 C, and has cutouts in the back for antenna, power, etc. It includes the shoulder strap, and is in good shape. $12

0.206 inch chassis mount jack
This is similar to what is used in the Drake HF gear for a microphone jack.
It is NOS, labeled JJ-033, with 2 conductors, plus the ground.
$6

PJ-068 Microphone plug - 0.206 inch
As used for a microphone plug on Drake HF gear. This one is in good shape, but it has been used, and has solder on the terminals. $8

Prices do not include shipping from Florida.

Thanks.

Wink -

Well the voltages with the NEW tube are much closer to what they should be.... The OLD tube is drawing considerably more current than the NEW one, indicating possible grid emission or gas problems.

You don't mention, but you DID readjust the Bias adjustment (Section VII, L) in the manual with the NEW tube installed.....??

From: jch39_99
Topic: 1766 Message: 1766

Okay guys.

Picked up a TR4 (not to be confused w/ the TR4CWrit I previously was asking about).

Well, I found a bad tube in the TR4 (6ev7) which when replaced solved some of the problems it was having. RX is now strong and the bias can be set normally.

I traded out the other tubes (except for finals) BUT I am still having a problem ... set bias okay, but can not get any increase in plate current regardless of the Xmtr Gain setting. Looking underneath I see no obvious problems.

I have Garey Service manual coming.

Any ideas where to start other than replacing finals (I currently do not have a spare set, I am willing to try and risk losing)?

Tnx for any assistance forth coming.

Garey- When I go through that Bias setting, I can only get S-5 max S-meter reading on the new tube.. With the old tube 20DB S meter reading as required.
Just no gain there....

1768. RV-4 attenuates both received and xmitted signals on the TR-4Cw/rit

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-03 02:21:32 UTC
From: ka2oig
Topic: 1768 Message: 1768

The RV-4 is the two tube model. When switched on, no matter position of the function (RCV, RCV/Xmit or Xmit) the received signal drops to zero, and the S-Meter goes to zero. On xmit with the TR-4CW/rit when the RV-4 is in RCV the output of the TR is attenuated to such a low rate of output that it is not copied by other hams in the QSO. When in Xmit or RCV/xmit the output is also zero.

I have checked the tubes and also replaced the tubes, checked the voltage on each pin and also the resistance at each pin - all ok. I've checked the cables between the cinh-jones connector and the solder joints of each line inside the RV - all ok.

This attenuation is that same whether plugged into a TR-3 or the TR-4Cw/rit.

Suggestons?

Walt and Garey,

My manual has a TR-4Cw and then there are added pages for the RIT as Walt mentioned, plus the photo on the front shows the rit control on the front lower right of the TR panel. It would be interesting to know "officially" if they ever did produce a manual with TR-4Cw/RIT or such on the cover.
Interestingly, the instructions for both the cw 500Hz filter and the RIT are inserted after the table of contents as pages iv through vii.

^Then the photo on page 1-2 is back to the old TR-4C configuration, that is w/o : 1) the RIT and NB buttons; 2) the RIT knob, and 3) the filter knob.

Wink -

OK, I think we have more than one problem. The fact that your are unable to correctly set the S-Meter adjustments with a "new" tube in V1 tells me that there is something wrong elsewhere.

First try pulling V9 and see if the S-Meter can be adjusted properly with a "new" tube at V1.

If that doesn't work, try subbing V4 and V5, again with a "new" tube in V1, to see if replacing one or both of them affects your ability to set the S-meter.

Well, I apparently have somehow offended the members of this board. I stopped getting responses to my queries for help. Not sure what I did, but I apologize I'm sorry. Thanks for the early help I did get. This is my last post. I will still be reading as I do get some great info that I can use.

I do not think that anyone was offended, just waiting.

>I have Garey Service manual coming.
>
>Any ideas where to start other than replacing finals (I currently do
>not have a spare set, I am willing to try and risk losing)?"

Have you got the manual yet? spare finals? if so please re-post
your questions..

Also, many of our members here stay pretty busy and only get to our e-mail every so often.
the rest of us may just not have an answer !!

Crit -

As my Grand-daughter says, "chill". You haven't done anything wrong, and just because you're paranoid doesn't meant we're not out to get you! :-) Answers do not always come back immediately.

We really don't have enough information to know where to point you.... By the way, it's generally NOT a good idea to swap all the tubes for "new" ones. There are several problems with this approach. The biggest problem is that any "NEW" tube is probably 40 or more years old, and may or may not be "good". With RF circuits in particular, minor differences in tube manufacture, especially from brand-to-brand, may require realignment. This can make a new GOOD tube appear to be worse than an old BAD tube. Much better to work with one circuit or function at a time, and if you suspect that A tube may be the problem try A new tube and note the difference, if any....

IF you can set the bias current, there is probably nothing wrong with the finals. While they may be "soft", if you can set the Bias current the DC circuitry is working and the tubes are not "dead". They're certainly good enough to allow you to troubleshoot the "other" problems.

Reading the Drake manual, especially the Circuit Description section, will point you to several possible problems. Step one is to understand what happens when you tune up. Since you have a TR-4CwRIT that apparently IS working, and that you know HOW to tune up, we'll assume that you know that the Sideband switch MUST be in the "-X" position.

So. You have Bias current, but switching to "X-CW" and increasing the XMTR GAIN and peaking the RF TUNE doesn't result in an increase above the idle current of 100 mA.

1. Do you have a key plugged in? If so, is it "closed"?

2. Does the VOX pull in? (Can you hear the relay click?)

3. Have you tried more than one band? (80M is a good place to start.)

IF all the above is OK, the first thing to check is to see if K2, the small relay under the chassis near the Balanced Modulator is pulling in. This relay switches a fixed capacitor in series with the Carrier Oscillator crystal to shift its' frequency up by about 900 Hz to put it within the passband of the filter. If you have a General Coverage receiver, you can listen to the Carrier Oscillator at 9.000 MHz, (you might need to run a wire from the GC receiver antenna input to the general area of the CO,) and listen to see if it is actually ON 9.000 MHz, and that it "shifts" to about 9.001 MHz when you switch to "X-CW".

1775. collins s meter

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-04 23:36:25 UTC
From: Mike Shelly
Topic: 1775 Message: 1775

I havn't gotton a responce from from the Collins group on this so I figure I'd try the Drake group.

I figure where there is a Drake can't be a Collins too far away.

I have a 75S-1 Receiver. The S meter is in very good shape but has a issue with the mechanical Zero and it sticks near Zero when no voltage is applied. Otherwise works well. But being anal have to fix it.

I e-mailed Simpson who manufactured the meter back in the day and they won't look at it.

So the question is, Anyone know who can fix a meter movement. Or give me some pointers on how to clean and adjust it mayself. Been looking on e-bay for a replacement. Anyone know of one for sale at a resonable price?

Many Thanks
Mike

Yes... at least in my case: I own a nice S-line and a KWM-2A :-)

Well, I can provide my recent experience fixing a meter movement in a 'new' (I got it with the promise it was 'new in box, perfectly working') Diamond SX-200 power/SWR meter. It had a bad habit: zero was not always at same point!. I could not understand it: it indicated power fine and repetitively in all power scales. But then, when neddle needed to go back to zero, most of the times it rested at another (higher) position, and not always the same. Tapping the meter got it back to the 'real' zero. I thought there was some friction which prevented movement... but, when I got the meter out, I found that it was really in pseudo-stable position when it was not at real zero!. I mean, if I tried to move the neddle to zero, manually (just slightly touching the neddle), it went back to the wrong resting position!

I was puzzled as there was no obvious mechanical trouble I could see... until I searched for D'Arsonval movement and ended, among other places, here:

http://www.engineersedge.com/instrumentation/electrical_meters_measurement/darsonval_movement.htm

As you can see, there are TWO control springs, one in the upper side (the one I saw and was perfect) AND another in the lower side. Even if I could not see it, I knew problem was there!. So I carefully dismantled meter (piece of cake :-( )... and, yes, there was a problem there: lower spiral was uncorrectly routed (probably from factory) so it was overlapped at one point. VERY carefully, I got it back where it should be, spiral was free again, and movement was fully restored.

Well, perhaps this has nothing to do with your problem but it could be somewhat related, as any minuscule metallic debris could have been stuck in the strong permanent magnet. Important thing here is that meter is a delicate thing and any small mechanical problem means a bad working unit.

Best regards,

JOSE

1777. Re: Another Query

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-05 13:10:05 UTC
From: tjb813
Topic: 1766 Message: 1777

At the risk of sounding trite, a mistake I have made with the TR series is not having the sideband selector on th "X" position in the tune mode. But you probably already know this and I just had to be sure of the simple things first.

The next thing I find is the 15 Ohm resistors in the cathode of the finals. Baring that...

Listen with another receiver and see if you can hear the carrier. If so, its probably in the driver (12by7) or the offset voltage to the balanced modulator fron the drive control pot. If not, check the mixer tubes. If the receiver is "up to par" then the filter is probably not an issue.

Alignment of the stages between the balance modulator and the mixers can have a pronounced affect.

Just a list of ideas to ponder and things to look at.

Let us know what you find.
PS I have rescued several basket case TR-3/4's. It's just a matter of patience and investigation.

I would say to pratice on a couple of cheap meters first so you can learn how delicate they can be.
I would hate to see you accidently ruin an original meter.

I will echo Jose's comments. Either one of the mainsprings could be
hung up. Other possibilities are the pointer could be very slightly
bent towards the faceplate or the scale plate and hanging up at that
single point. Or there could be a small metal filing stuck to the
magnet. Or the jewels could be misadjusted.

As has been mentioned, be VERY CARFUL. Work on a completely clean work
area - little bits of metal stuch to the magnet can be extremely
difficult to remove. Work under magnification if at all possible.

Very good points thanks! What I would like to do is get another working meter fix this one and sell it on ebay to pay for the replacement. If I do *&^% up at least the radio will remain intact. My gut tells me the problem is simple. I only need to plung into it without screwing up!!

Thanks for the info.

If anyone has a meter you can e-mail me offline @ wb2kki@yahoo.com.

Ok Garey -- I tried all three, no change. Pulling V9 - Replaced V4
And V5 -- No change. Old tube still working..
Any tips?
Thanks

Wink -

OK. Let's be sure we're saying the same thing......

You put in a "new" 12BZ6.

You pulled out V9 and laid it on the table. You adjusted the Zero pot on the back, and then tuned in the Calibrator at 3.8 MHz and adjusting S-Meter Cal only up to S-5 instead of S-9 + 20. Turning the RF GAIN control full CCW, the S-Meter went up to... ?.

Then you subbed new tubes for V4 and V5, leaving V9 on the table. Then adjusted the Zero and RF GAIN as above and still the S-Meter wouldn't go above S-5.

Wink -

What is the voltage at TP-2, top of chassis, just in front of passband tuner. Should be -1.35 V with no antenna, no signal.

Garey - K4OAH

Garey - That is correct. Thatis what I did.
I will check the TP2 voltage later today.
Thanks...

OK. With V1 out, see if you can set it to -1.35V with the RCVR SENS
(R87) control, near center-line of underchassis towards front panel.
Then reset S-Meter ZERO and S-Meter SENS.

Then try setting ZERO to max. Should be able to reach S-6 to S-8.

Garey , Sorry , I forgot I had the OLD tube in there. With NEW tube
it measures -1.66V

Wink

OK. Set it to -1.35 with a NEW tube. Then try the adjustments below.

OK... Sounds to me like it's working correctly. How does it sound
with an antenna?

Weak compared to the old tube. Just no real S-meter readings
and sigs weak....

From the measurements you made this morning, it sounds like the OLD
tube is gassy, and dragging down the AVC voltage, thus increasing the
gain of the receiver. Which makes it "sound" hot and big S-meter readings.

How does it compare to another receiver on the same antenna? How do
signals compare between the two, disregarding the S-Meter readings?

I've compared it to my FT-857D and it is very weak. I can't even get an S meter reading from the SPOT signal on my T-4XC sitting right next to it. With the old tube sigs are comparable to the 857D, just lowere noies level readings on the R-4.

Wink -

Well, I dunno..... I still think the OLD tube is masking what the
"real" problem is, but I'm out of ideas for what it might be.

We did determine early on that the OLD tube is a 12BZ6, and that the
socket really has 12.6 VAC on it. I sure liked the idea that the socket
was rewired for 6 V..... :-) Too bad that's NOT the problem.

The only thing I know to do is to measure PTO and PreMixer levels and
the stage gains for the RF/IF stages and see where it's getting lost.

Maybe someone else has an idea? SPEAK UP!! :-)

Well I just triple checked and Yes it is a 12BZ6 and Yes, there is 12.6 VAC on it. I just did a quick check on an S9 sig on 80M, pulled old tube and put new one in , and No S-Meter reading and he was much weaker.Guess I'll just run the R-4 till the gassy tube gives up and then go back to my 2-B. Keep me in mind if you come up with any ideas as problem continues to baffle me also. Thanks for all your help
Garey.

1801. Replacement Speaker

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-07 23:32:40 UTC
From: Jim Gerke
Topic: 1801 Message: 1801

I have an MS-4 with a speaker that is no good and needs to be replaced.

Any suggestions on where others have found an acceptable replacement
would be appreciated.

Thanks in advance.

I would say to pratice on a couple of cheap meters first so you can learn how delicate they can be.
I would hate to see you accidently ruin an original meter.

Yes... at least in my case: I own a nice S-line and a KWM-2A :-)

>I have a 75S-1 Receiver. The S meter is in very good shape but has a

>resonable price?

Well, I can provide my recent experience fixing a meter movement in a 'new' (I got it with the promise it was 'new in box, perfectly working') Diamond SX-200 power/SWR meter. It had a bad habit: zero was not always at same point!. I could not understand it: it indicated power fine and repetitively in all power scales. But then, when neddle needed to go back to zero, most of the times it rested at another (higher) position, and not always the same. Tapping the meter got it back to the 'real' zero. I thought there was some friction which prevented movement... but, when I got the meter out, I found that it was really in pseudo-stable position when it was not at real zero!. I mean, if I tried to move the neddle to zero, manually (just slightly touching the neddle), it went back to the wrong resting position!

I was puzzled as there was no obvious mechanical trouble I could see... until I searched for D'Arsonval movement and ended, among other places, here:

http://www.engineer sedge.com/ instrumentation/ electrical_ meters_measureme nt/darso nval_movement. htm

As you can see, there are TWO control springs, one in the upper side (the one I saw and was perfect) AND another in the lower side. Even if I could not see it, I knew problem was there!. So I carefully dismantled meter (piece of cake :-( )... and, yes, there was a problem there: lower spiral was uncorrectly routed (probably from factory) so it was overlapped at one point. VERY carefully, I got it back where it should be, spiral was free again, and movement was fully restored.

Well, perhaps this has nothing to do with your problem but it could be somewhat related, as any minuscule metallic debris could have been stuck in the strong permanent magnet. Important thing here is that meter is a delicate thing and any small mechanical problem means a bad working unit.

Best regards,

JOSE

1807. R4B Insensitivity

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-08 19:46:08 UTC
From: k8aja
Topic: 1807 Message: 1807

I recently traded for a Drake R4B and T4X from a good friend and am having difficulty with the receiver. The R4B is very insensitive. It takes about a 0.7 Volt (yes, I really mean volts) signal to get an S-5 on the S-meter. I have checked all the tubes and they appear to be OK. I was going to start the alignment procedure, but surely it can't be that far off. I have heard there are some "usual suspects" of capacitors between stages.

R4B serial number is 8278R. Any help to get me started would be appreciated.

For the voltage at TP-2, I get -1.38 vdc.

I took the voltage readings on all the tubes. The Drake Manual number and my numbers are in the attached spreadsheet. I see some definite differences. I can e-mail the Excel Spreadsheet. I highlighted the outliers in red.

I did have to use a digital multimeter. I have to recalibrate my VTVM.

1808. File - Bi-Weekly Statement

Yahoo group: DrakeRadio (2006 — 2011)

From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 1808

All group memebers are welcome to post here on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others (what you put into this group you will get back so participate if you have a chance). Although we would like to focus on Drake Radio subject matter any Ham Radio subject matter is allowed. This includes any QST's of events or hamfests, especially if Drake radios are included

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our groups home page, as well as links to Drake information or your homepage.
Thanks to all members for your particapation.

Hi Les and the group. Radio Shack made a 5"x7" speaker that has been used to replace the MS-4 speakers. Unfortunately it was discontinued a few years ago. You can still find them new on ebay now and then, the RS # is 40-1261C. I just referred Jim to one that was new for sale on Ebay. Also Surplus Sales has a speaker that looks like it should work thanks to a tip from Mike kb2kki. Here is a link to it, it's about 1/2 way down the page.

Hi
Anyone put me right please.
Is the 6JF6 Ok as a replacement for the finals in the T-4XC without mod?
If so, what are the up and down sides performancewise. Also what about
the bias?
73

Vic -

Never tried them, but ....

Considerably higher capacitances, probably need neutralization modification.

Higher transconductance, possible instability problems.

Probably "'could" work. If on hand, or much cheaper. Otherwise better
to stick with 6JB6.

6GJ5 is a good sub.

Higher filament current, unsuitable for TR-4 series. (Series/Parallel
filaments.)

If you try, let us know!

Hi Garey

Thanks for info.

I have a dead T-4XC that has had some mods done to it on the rtty board and probably elsewhere. . Haven't really had a look yet but thought I would give the valves (tubes) a try and see if they worked. So tried them one at a time in one of my working Tx's and they were all ok until I came to the PA's and found them to be 6JF6's. Didn't try them - wasn't worth the risk.

I regret I won't be able to let you know (chicken) 'cos I'm not prepared to zero a good working T-4XC for experimental purposes!!

I knew the Tx was dead when I bought it so if I can't get it to work I have a complete set of spairs.

1816. T-4XB Tuning

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-11 18:58:48 UTC
From: John E. Beck
Topic: 1816 Message: 1816

Greetings.

I have started to re-learn how to tune a tube transmitter. (It seemed easier with the Heathkit SB-102 back in the early 70's, but that could be faulty memory.) I have used the instructions from the Drake manual, along with other material gathered from the Internet. The emphasis from all sources is to limit the amount of time the circuit is not resonant. But the amount of time spent in the tune mode is never specified. The only reference I have found to date is from a web site with tune up instructions for a Signal One. They state:

"Be sure to observe the 5 Second limit in TUNE and wait at least 15 seconds before going to TUNE again."

In your experience, does that advice sound like a reasonable rule of thumb?

(I could be over-reacting to a growing fear of ruining the rare and expensive finals before my learning curve flattens out!)

Thanks in advance for your advice.

I imagine that, if you can find the stats on that speaker, you should be able to find a suitable replacement from a modern speaker company. Might even be able to make it sound better.

I have an icom sp-3 (actually, two of them) and love the sound of it (Granted, they are not wired up to my Drakes). I believe one of teh reasons is because they are closed/sealed speaker boxes.

Maybe closing off the ms-4 box with the proper speaker, since you are replacing it anyways, will give an even nicer sound than the original. If you are not using the box for the power supply some insulation, like used in winter jackets, placed in the closed box can be used to change the tone as well. One cavaet: sealing all the seams will be necessary when closing off the box or you will get whistles and rushing air sounds thru them.

Food for thought.

God bless

1818. Re: [DrakeRadio] T-4XB Tuning

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-11 20:34:23 UTC
From: Garey Barrell
Topic: 1816 Message: 1818

John -

IF the final is tuned to resonance, (the DIP,) you can stay in TUNE mode as long as you want. In the Drake transmitters the Final screen voltage is reduced in TUNE to limit the off-resonance current, but the tubes will still draw enough current to damage themselves or the transmitter/power supply if they are allowed to stay OFF resonance for more than a few seconds. If you have a problem getting the PLATE adjustment to dip within 5-10 seconds, something is wrong. Perhaps the wrong antenna is selected? Antenna tuner misadjusted? NO antenna connected? The key is to find out WHY the Final won't dip with the key UP! :-)

There is a class of user that tunes up their transmitter by keying the transmitter, then looking for the manual for directions, then looking for their glasses so they can see the manual and/or the meter, and THEN dip the PLATE. Sweep tube (or other) Finals don't last long under these conditions.

A small fan either sitting on top of the Final cage area or mounted on the back wall of the PA cage, blowing _OUT_ , will go a long way to extend the tube life. You don't need a hurricane, just a gentle, silent flow of air to move the heat away from the PA area and away from the transmitter.

Ah - that's good to know.

> If you have a problem getting the PLATE
> adjustment to dip within 5-10 seconds, something is wrong.

No problem with that. I have found that dip quickly each time.

Yep - 12 VDC fan is in place - one on the transmitter and another one
on the R-4B receiver. (See - I am paranoid!)
Thanks again for the information. I just wanted to be absolutely
certain I was doing this right.

1821. Wanted R-4B and a T-4XC

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-12 01:12:00 UTC
From: de_n7ioh
Topic: 1821 Message: 1821

I have decided to get back into the Drake gear and I am looking for a R-4B and a T-4XC. While I am not looking for showroom condition I do want something I can be proud to display. I am wanting a R-4B with a serial number over 10501 and a T-4XC with a serial number over 26670. I never sold my TR-6 and AC-4 so I am good there. Please PM me with what you have and your asking price.

Al, n7ioh

1822. What did Drake use for tubes?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-12 01:44:42 UTC
From: de_n7ioh
Topic: 1822 Message: 1822

I was looking in my TR-6 manual and noticed that Drake specified certain brand tubes in some locations.
V-5 6BZ6 (RCA) calibration generator
V-6 6GK6 (Sylvania) Transmitting driver
V-8,9,10 6BJ6 (Sylvania) (Match set) XMTR output amplifier
V-13 12AX7 (Sylvania) AGC generator
V-18 12AX7 (RCA) microphone amplifier

Anyone know what Drake used in the other locations or should I be concerned when replacing any of the other tubes? Recommendations?

Since I will be getting a R-4B and a T-4XC later I also would like to know about the tubes in these radios. The Drake manual for these rigs really does not say to use any particular brand of tubes. From my reading I know that for the finals the Sylvania is the preferred tube but what about the other tubes? Any brand of tubes we should stay away from?

Thanks, Al n7ioh

Well I hope I'm not doing something wrong? I had the R-4B receiver before and liked it better than the stock R-4C that I had. From what I read any of the 4 line receivers can be used with any of the 4 line transmitters. I had the T-4XC and it worked well and has a few extras that the T-4XB doesn't. I just thought it would make a better package. Did I miss something? I always welcome your input Garey.

Well you made me go back and look. It's really not much of a
difference after all. The T-4XC did away with the 0A2 tube regulator.
It has a solid state VFO and premixed injection which is suppose to
be an improvement. It has an external crystal socket on the front
panel which I will most likely never use. There are a few extra
connections on the back including a RTTY hookup. It is more readily
adapted for use on VHF which I might try someday. There is no copper
chassis which some like and some don't. I don't mind the copper if it
looks good but most are showing their age and a nice one is getting
harder to find.

From: Garey Barrell
Topic: 1821 Message: 1827

OK

The B used the +150V bus from the 0A2 to power the Carrier Oscillator along with the screens of the IF Amp, Mixer and Premixer stages. The CO of course was for frequency stability and the screens were for improved linearity. The 0A2 was removed in the C, primarily because the Carrier Oscillator was changed from tube to transistor. Any linearity and stability improvements enabled by the screen regulation was given up. Probably not significant, but a slight downgrade.

The PTO is SS in ALL, the early B used a Bipolar transistor, (< s/n 13750,) late B and C used a FET. ALL use the PreMixer system, a 6HS6 in the B, 6EJ7 in the C.

No provision for crystal control in the B.

There are no VHF connections on the back, only holes for connectors. Same as the B.

The RTTY jack only shifts the audio bandwidth to allow higher tones associated with 850 Hz shift RTTY. No value with current Sound Card based digital modes.

The C DOES have a few improvements:

Alodine chassis instead of copper. The alodine is not always perfect, but generally less subject to corrosion than the copper.

Uses dial light for "PTO in use" indicator rather than neon fiducial in B. BUT only works with R-4C.

Phase locks the CO and BFO, eliminating the "Transceive align" problem, but ONLY with the R-4C.

REAL improvements when used with the R-4B:

Mic jack on the back panel instead of the side.

Separate VOX DELAY pots for SSB and CW.

Dual dial discs for 1 kHz readout on DIAL rather than dial and knob skirt.

Personally, the only USEFUL improvement, when used with the R-4B, is the dual VOX DELAY pots! :-)

From: Garey Barrell
Topic: 1822 Message: 1828

Al -

Interesting! I've never owned a TR-6, and hadn't seen that.

Drake used Sylvania and RCA tubes almost exclusively until the late stages when certain types of tubes became hard to obtain in production quantities.

My experience has been that for Finals, Sylvania, Zenith (all made by Sylvania), RCA and GE are best, in that order. Sylvania is the only manufacturer that actually evaluated and characterized their sweep tubes for RF use, so hopefully would not have changed any manufacturing methods to invalidate that information. The fact is that those tubes were designed for use at 15 kHz TV Horizontal sweep use, NOT at 30 MHz. So interelectrode capacitances, internal lead length and arrangement, and other factors were NOT necessarily of concern. Raytheon, Westinghouse and of course the International, Supreme and other "generic" brands and rebrands are all suspect and may or may not work, depending upon who "really" built them.

Generally speaking, small receiving tubes are much more consistent, and are typically interchangeable from brand to brand. Personally, I stick with "real" brands such as Sylvania, RCA, GE, Amperex and Mullard, since these are almost always made by whoever has put their name on them. There was always a certain amount of rebranding amongst even the major manufacturers because of scheduling and availability, but tubes were their business and they couldn't afford to risk damaging it.

My guess on the specific brand tubes specified for the TR-6 is the result of pushing the envelope and empirical data showing that these brands worked in the particular circuit better than another. I understand using the Sylvania tubes for the RF stages, perhaps the RCA tube showed better harmonic generation than the Sylvania, maybe the RCA 12AX7 had less hum as a Mic Amp. ??

Also, doesn't the T-x4c have metal gears, as opposed to plastic on
the T-x4b?

Hi

Well don't know about metal gears. My 3 T-4XC's all have nylon gearing and a definite No,No for oil - unless you want a problem.

The very latest R-4C and T-4XC units had metal gears. They are of questionable value, slightly noisier. Probably a cost decision in that they were cheaper than the quantity that would have to have been ordered to make more nylon gears.

The nylon gears are actually "better", as long as no-one oils them!!

The "collectors" want them because they're "rare"!!

Oops!!

It has been brought to my attention that I missed one of the most important differences between the B and C transmitters.....

The C has a PLUG-IN T/R relay! That could be a deal-breaker. There is/was a kit available to replace the B's wired-in relay with the standard plug-in relay used in the C. Even if you are able to buy or build a kit, the installation is no walk in the park.......

So the bottom line now, (at least to me,) breaks down to:

IF you go with the B, you give up the plug-in relay and the PTO in use lights

IF you go with the C, you GAIN the plug-in relay and the dual DELAY pots.

I guess I'd choose the T-4XB for use with the R-4B if someone had already converted the relay! I have two B-Lines, and the relays are still fine, but....

Hello

Whilst relays are under discussion in the 4 series perhaps someone can help on this. I mentioned that I had a dead T-4XC previously.

So here we go:-

1) There is a mini jack point fitted on the rear chassis apron with a couple of leads that lead to the relay board and presumably parelleled up with a pair of relay contacts. I don't know which at the moment as I haven't progressed that far. But I am informed that there are 2 differing relay boards for the T-4XC so my cct. dia may be the right/wrong one.

So the question is, ' if there were different relay boards fitted to the T4XC what was the difference.'

.

Whilst I am nattering away I may as well mention the last point. There are also a couple of leads coming out of the back which lead to the Cinch-Jones plug - obviously a supply for something. Haven't checked which pins they come from yet. Also Q4 has been removed from the rtty/buffer board along with a cap. Why? I don't know.

Main question is were there different relay boards and how did they differ.

All help welcome.

Vic - G4JSS

Vic -

I'm not aware of different relay boards in the two versions of the T-4XC. The original design, starting with s/n 20181, had a 15k ohm T/R relay that proved to be unreliable. The coil wire was so thin that it often broke, usually at the point where it attached to the terminal, either from corrosion or thermal flexing. The second version, starting with s/n 26670, had the 2.5k ohm relay. This change required the addition of a 1.5k, 1W resistor in series with the relay coil. This resistor was mounted at the socket for V10, so would not have required a change to the relay board.

The attached photo is from my CD, at reduced resolution, and is of a "late" relay board. R49 and R59 have obviously been replaced at some time.

The RTTY circuit was used to shift the Carrier Oscillator to favor the high frequency response to allow use of the higher audio tones used with 850 shift RTTY. Of no value for today's sound card based digital modes.

Qsl the info. It seems then that the relay board had the same cct. as the original but - depending on whether there was a 15k or 2.5k relay an addition of a resistor which was not mounted on the relay board..

Let you know how I go on when my grandkids give me time to look deeper.!!

OK, I have purchased a T-4XC and should have it in a week or so. I am still looking for the R-4B.

Thanks, Al, n7ioh

> I have decided to get back into the Drake gear and I am looking for a R-4B and a T-4XC. While I am not looking for showroom condition I do want something I can be proud to display. I am wanting a R-4B with a serial number over 10501 and a T-4XC with a serial number over 26670. I never sold my TR-6 and AC-4 so I am good there. Please PM me with what you have and your asking price.

Hello Group

I recently acquired T-R4XC (SR-27622) and an R-4C (SR-26525)with all documentation, repair records from Drake, and sales receipt. The equipment appears to be like new with no modifications that I can see anywhere. I do not believe the radios have been used for a few years. I am not sure if I want to send these off to have them brought up to factory specs if needed or to sell or trade them.
Would these be considered collectors items. Can someone tell me what the equipment should be worth.

Thanks for any help.

Thanks,
Randy / n4jzy

I have just a little more than that invested but do not feel to bad considering the shape of the equipment. I had considered the Sherwood mods but thought it may devalue the equipment. Sounds like I may want to go ahead with them.

Be prepared to fork out $$$$....These just modify the receiver and are the only sanctioned mods for Drake that will actually increase their value. But do them while you can...Rob Sherwood won't be doing these for much longer....I have no regrets having done mine. I also have a high serial number, like yours....This hobby is $$$ driven, as you know :-)

From: LEE BAHR
Topic: 1801 Message: 1845

I think about a week ago someone was talking on here about putting their Drake treansceiver in a mobil operation and needed a DC supply. I was over at a friend's home, yesterday, that has a DC-3 Drake Power Supply excess to his needs. He is Rich, W4GKR. He and I live near the Houston, Tx area. Rich's father was a ham and owned the DC-3. Rich's father is a silent key and Rich has his father's equipment. The DC-3 is untested and I suspect not used in a very very long time. If that person wanting a supply wants one, you can reach Rich at w4gkr@... Rich told me he would like $60.00 for the supply plus shipping. Being a CD supply, it does not weigh as much as an AC-4 supply. It is available AS IS and has no quarantee as it has been untested by Rich. I would suspect the electrolytic caps should be replaced internally before use as is normal with something this old.

From: DALE PARFITT
Topic: 1846 Message: 1846

I have a clean T-4XC S.N. 28XXX for sale. Although I have never used it on the air, it does make 100W on 80M and 70W on 10M. VOX and SSB appear OK. The cabinet is excellent and the front panel appears as new with the exception of some of the very outer edge, which is covered by the cabinet lip. Knobs are shiney with good striping.
Chassis has light spotting. A previous owner got over aggressive on cleaning the rear apron so the S.N. is light- but visible and there is also a clear label with the SN in black type. $200 shipped CONUS UPS.
I also have an AC-4 in good working order- case has some scratches and a small ding on one corner. $95 shipped UPS CONUS.
At one time I was going to set up C line separates, but my TR-4CW/RIT with an AM filter has proved a delight to use on all modes so I have abandoned the T-4XC/R-4C idea.

Hi

Whilst we are on the subject of AC4 does anyone know if the Heathkitt shop is up and running.

Tried to get an AC4R 5 or 6 weeks ago but he'd had an accident (crushed his hands) and would be out of commission for a few weeks.

Check with an elevator repair company. They may have some short lengths
of multi-conductor control cable laying around. Be aware that if the
wire guage is too small to carry the load of the filament supply and
the AC primary, you will need to parallel conductors. DC breakdown
rating of the insulation is also a concern.

The 10v regulator uses the venerable 723 chip, and should be pretty
stable. The pots, on the other hand, leave something to be desired.
There's a writeup on the internet from a ham who replaced all the pots
with 10-turn trimmers. A very good idea. You could try cleaning the pot
with alchohol and resetting.

A generic 12v (or 14 v) lamp, nothing special. I like the Radio Shack
"12 Volt Micro Lamps", they seem to have a phenomenal life in anything
I use them in. They have tinned wire leads, so you will have to do the
solder-and-heatshrink thing.

LEDs are doable, with suitable current limiting resistors. Should fit
right in. The last time I checked, it was a buyer's market on the 'bay
for high brightness Chinese LEDs of just about any color you want. You
could go nuts and make them all blue.

Why not use antenna rotor cable? It comes in grey - use the heavy duty for long runs type.

Subject: [DrakeRadio] Re: AC-4 Cable

Does anyone have a source for the power supply
cable itself used on AC-4 supplies? I have had a supply needing a cable
lying around here for a long time and it is unusable. I'd like to buy
some
grey jacketed cable with enough wires of the correct size to replace
the bad
one. Internal wire colors could be anything. I never "bundled"
discreet
wires on it as I always felt someday I'd find an appropriate cable to
use as
a replacement with the proper looking jacket. That never happened.

I would check on the DC voltage ratings on any rotor cable. You want,
probably, 1 KV breakdown resistance at MINIMUM for the high voltage
feeds.

Good point. I'll check, but I'll bet they don't know or have any specs on rotor cable.

You might want to look for an old Heath HP23 cable and just change out the connectors. Should carry the current with no problem.

I THINK most multiconductor cable used as rotor cable is specified as 600V insulation, which would make 1200V from conductor to conductor. Should be fine barring physical damage. Of course you have the external sheath to add to any individual conductor's insulation for "outside the cable" protection.

I also believe that those numbers are guaranteed breakdown, meaning there is an additional safety factor. The highest voltage in an AC-4 is ~700VDC, so should be well in range. All these numbers are for good Belden cable, polyvinyl junk from China is another story.

Collins guys have the problem of 1000V plus unloaded B+, which is why the "blue" connectors are necessary on the 32S-x transmitters.

Thanks, Garey. I figured such was probably the case. The Wire Man sells 2-12 plus 6-16 and also 2-14 plus 6-18 rotor cable. I am waiting for a reply as to outside diameter of these cables.

Buying multiconductor cable from places like Mouser, etc are crazy as they sell in 500 to 1000 foot spools. At least The Wire Man will sell by the foot.

From: Victor Waddington
Topic: 606 Message: 1866

Hello
Mentioned earlier that I had a dead T-4XC (knew it was dead when I bought it) so have not tried connecting it up.
Done a few resistance checks as per the handbook - need to ensure that the DC cct OK first.
V1 - 3 OK but when I come to V4 (driver) I do not correspond to the resistance chart in the handbook on pins 1 & 2. On pin 1 I get a reading of 10k but the handbook tells me I should have infinity. I can't figure that as R136 (10k)is connected to pin 1 and ground. So how do we get infinity?
Pin 2 gives me a reading of 58k but the chart says 97k. How do we arrive at that?
Anyone help, please.
Have a lot of other questions as well but it will be better to deal with one thing at a time.

Jim,

I'm the guy that replaced all of the pots on the regulator board. My TR7A has worked very well since I did it last year. By switching to 10 turn pots it made setting the 10 volts and the offset frequencies very easy and precise. I haven't measured anything since I did it, and haven't had any comments about being off freq or noticed any problems with drift or frequency related errors. I forwarded the info and I think the pictures to one of the guys that maintains a web site on the Drakes. If you need the part numbers I'll dig them up and send them to you or anyone who would like them.

Good luck and 73,
Bill Taylor

Hi Garey

I'm pleased that the book is in error re the 10k. I'm also a bit concerned about the reliability of that chart. I think it was V10 where it says that pin 9 should be 0 but in fact there is no connection.

Now back to the other problem re V4, pin 2. It wasn't in spot and no matter which position I put it in I get a reading of 58K. Done a quick check on the rotary switch and that seems OK.

Actually, it was Carel PA0CMU's page here that I was thinking of:

http://members.ziggo.nl/cmulder/drake.htm#bookmark5

But I knew others had done it as well. It appears that there are two
versions of the PS board, and different pots fit better on each one. I
would be interested in your part numbers, but I'm not sure which
version I have at this point.

Vic -

OK. Well, according to the two version schematics that I am aware of, the 56k resistor R41 is the only resistance between Pin 2 and ground via S-2A (front) which is part of the TRANSCEIVE switch, _WHEN_ and only when, the switch is in SPOT. There are several other paths from the "ground" end of R41 via large value (1M) resistors to the -55V Bias supply bus.

Personally, I have never paid much attention to the Voltage and Resistance charts. I have found quite a few errors, usually the result of engineering changes where the schematic is changed, but the charts are not. Especially since there is no correlation between charts and schematics. I don't think I've ever used the Resistance charts in 50 years of working on Drakes. Once you know the bus voltages, it's pretty easy to estimate what various element voltages "should" be just by looking at the circuit and associated resistors, certainly within 20%. If a voltage looks out of reason, I then check the associated resistors for marked values. Sometimes you have to compensate for parallel resistance paths, but often one end is "open".

Much appreciated Garey. Will have another nose around.

Yep there are certainly discrepancies on the R chart and I would prefer V checks but as things stand I haven't plucked up the courage to apply power - at least until I am reasonably happy that DC path OK. Me and that magic smoke don't get on well!!

If a voltage looks out of reason, I then check the associated resistors for marked values. Sometimes you have to compensate for parallel resistance paths, but often one end is "open".

Vic -

I'll tell you what I do with a "new" T-4X(any).

Start with the AC-4. FIRST step is to check the fuse. I have found everything from a "correct" fuse of 5 or 6.25A (120 VAC) Slow Blow all the way up to a piece of #6 copper wire cut to length! Next, I check all electrolytics with an ESR meter. If you don't have an ESR meter, you can either build a suitable substitute, or last resort is to use an ohmmeter just to determine that each cap section is (A) not shorted, and (B) reads a low resistance, increasing as the cap charges. Check the diodes with an ohmmeter or DMM with a Diode Test function.

The T-4X(any) has a few resistors that need to be checked. The cathode resistors R53, 54 in the Final should be 15 ohm +/- 5%, and preferably within 5% of each other. The screen resistors should be 68 ohm, R50, 51. Check R59 for value and condition, then measure the exact value with a DMM. Check R44 for value and condition. This resistor is often damaged by someone using a metal screwdriver to adjust the trimmer capacitors. Even a momentary short to the chassis from one of these trimmers puts the entire +250V supply across this 1/2W resistor.

Apply power. Check idle current of PA stage as described in manual. Measure voltage drop across R59 with a DMM and calculate the current using the resistance measurement made earlier. Verify meter reading for accuracy. If meter is NOT reading actual current, change resistor R58 (located up on slide switch behind LOAD control) to correct meter reading. Measure resistance of R53 and R54. Measure voltage across each resistor at idle and compare. If these voltages are not within 5% of each other, you have a weak final tube.

TUNE transmitter into a dummy load. Good finals should produce ~130W on 40M in TUNE mode, ~110W on 10M. Less power and/or considerably less power on 15 and 10M indicates soft finals. If a "touch-up" alignment of transmitter doesn't improve, replace finals. Check neutralization per manual. Finals should be of same brand, preferably Sylvania, Zenith, RCA or GE, in that order. Best if both the same brand, and approximately the same "age", i.e., don't mix an old tube and a new tube. If neutralization is way off, or new tubes, check neutralization first on 20M where the null is broader. Then go to 10M where only a slight touch-up should be necessary.

Enjoy!

From: LEE BAHR
Topic: 1801 Message: 1876

Well I ordered some rotor cable from The Wire Man today. What I ordered is a cable just less then 1/2 inch in diameter that contains two #12 wires and also six number 16 wires. I plan to try it out and replace a burned out cable on an unusable AC-4 power supply I have had sitting here for a very long time.

Hopefully it will work. I'll let the list know if it can withstand the high voltage. Hopefully the wire size can also handle supplying filament voltage to a Drake TR-4. I would think #16 can handle the AC primary current for the on-off switch with no problem.

Lee -

#12 copper wire will drop ~9 mV/ft @ 5.5A, which is the filament current for a TR-4C. So if you have a six foot cable you'll lose about 0.1V of filament voltage. #16 is fine for the primary current.

The only remaining concern would be the voltage breakdown of the insulation.

I think it will be OK voltage wise but I'll try it and let everyone know how it works out. Thanks for the input.

As a side note, I looked up the 12 pin male and female plug and jack for the power supply and radio. Mouser's p/n for the 12 pin female socket which is on the end of the power supply cable is: p/n 538-38331-8012 . It sells for $7.74. The chassis mounted plug is p/n 538-38330-0112. It is mounted on the radio. It sells for $3.76. The brand is Molex. They do have Cinch-Jones plugs and jacks but they only stock up to 6 pin variants.

Vic -

The Varley relay was a known weak link in the T-4XC. The fine wire
needed to enable 15k impedance was so fragile that the relay core
expanding and contracting with humidity and temperature changes snapped
the wire. The P&B (TYCO) relay R10-E1Y4-V2.5K relay available from
Mouser, Digi-Key and others at 2.5k impedance resolved that problem
and was used for all replacements in T-4XC and TR-4C that originally
used the Varley. It DOES require the addition of a 1.5k, 1W resistor in
series with the coil. Look at the socket for V10, either a 6EV7 or 6FQ7.
Remove the wire connected to Pin 6 and move it to Pin 9, add a 1.5k, 1W
resistor between Pin 6 and Pin 9, and plug in the new relay.

Hello again, Garey

Thanks again for info and, even better, the way to do it.

Tell you what puzzles me, if the original relay was 15k and you replace it with a 2.5k then I would have thought that a suitable series resistor would have been in the region of 12k. Probably due to current requirements - I don't know.

Yeah, does make you wonder.... :-)

The situation is that the 15k ohm coil is more "sensitive", i.e., pulls
in with less current than the 2.5k coil. Magnetics is one of those
"black magic" fields, kinda like RF! Interesting is the fact that the
6EV7 tube was originally designed to operate the remote control relay(s)
in early TVs, and was specified for use with a 2.5k relay! With the
1.5k resistor, there is approximately 20 mA through the 2.5k relay coil.

Garey,

I've been using the same Digi-Key relay in my T4XC for quite a number of years, 7 or 8 years I believe, without the 1.5K resistor. It has worked just fine without the resistor. However, that doesn't mean it's right so I'll add the resistor as you indicated. Good point.

Mike -

I'm sure it would work, (obviously!) :-)

It exceeds the maximum current for the TYCO relay by about 10%, hardly catastrophic. Drake considered it important enough to add the resistor in production and in the late version schematic that shows the 2.5k relay. Omitting the resistor is probably harder on the 6EV7 than it is the relay. Unlike transistors, tubes don't saturate to near 0 volts, so any additional current increases dissipation a lot faster in a tube switch. Omitting the resistor increases the tube dissipation by 2 Watts. Again, obviously not critical, unless you report that you have replaced your 6EV7 three or four times in that 7-8 year period! :-)

I haven't replaced the tube. However, to help reduce the current drawn
by the tube, I'll use the resistor. 10 cents for a resistor is better
than $10 for a tube.

Thanks Garey.

1891. Dead T-4XC

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-21 16:38:41 UTC
From: Victor Waddington
Topic: 1891 Message: 1891

Hi all
To continue this saga on reviving my dead T-4XC.
I was trying to get the DC cct. OK before I plugged it in. Thanks to help from this group I was getting ahead famously until I got to the PA stage. According to my schematic there are two 68 ohm resistors on the screens - R50 &51. On one of them I get the correct reading from pin 7. On the other I get infinity. Checked it and found that it wasn't wired to pin 7 but to a pin on the base that would normally be pin 1 - except there ain't no numbered pin 1 - they don't start until 2!
If you make sense of that please let me know why one of these resistors should go to a ghost pin and then via a cap to earth.

Vic

Vic -

You're making things harder than they are.....

The screen grid of the 6JB6 tube is connected to Pin 7 _AND_ Pin 1...! Because of the mechanical layout of the PA stage, one 68 ohm screen resistor goes to Pin 7 of one tube, and the other 68 ohm resistor goes to Pin 1 of the other tube. Same-O, Same-O.

Hi Garey

Thanks for info. All OK now. It would have helped if the schematic had numbered pin 1 although I should have realised. And (don't laugh) it would also have helped if I had remembered that I had taken the tubes out!!

From: hetman45
Topic: 1894 Message: 1894

Hello,

I now have a E-tek FR-4 TR excess to my needs which I would be will to trade for a FR-4 or any other freq. readout device for the Drake R-4B. I would also sell the FR-4 TR for $225 shipped to the CONUS.It is in very nice original condx. and I have a copy of the manual. 73, Joel AE2JL

1895. Anyone here tell me more about a Drake 2M/220 rig?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-22 01:45:31 UTC
From: w3rxo
Topic: 1895 Message: 1895

I have been offered a Drake 2 meter/220 rig, that is not working. No other info on it yet, but will be looking at it later this week when I pick up a dead set of "C" Twins. Were there more than one radio made with this capability? He didn't say if it was mobile or base, I presume mobile, but, who knows? Would it be AM, SSB, FM, CW or any combination of those? If it were to get up and running, is it still a viable radio? Would it have a collectible value?
If anyone is able to point me in the direction of more info, like a webpage about the rig(s) which fit this description, any and all info would be very helpful.

1896. T-4X Tune Up Procedure

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-22 01:50:49 UTC
From: Randy
Topic: 1896 Message: 1896

Is the tune up procedure as shown in the T-4X manual the best procedure? That is, RF Tune for 150ma then dip the plate. Then RF Tune for max plate current making sure the plate current is still dipped. Finally, increase GAIN until plate current no longer increases. It sounds simple, but are there any opinions on this? Any other suggestions or warnings?

Thanks for your help and 73.

Randy - K8HRO

1897. Re: [DrakeRadio] T-4X Tune Up Procedure

Yahoo group: DrakeRadio (2006 — 2011)

From: Dan Galligan
Topic: 1896 Message: 1897

After Jeff Covelli did his magic on my "B" Line Twins, he told me that so long as the finals are properly neutralized, it is only necessary to tune for maximum output, but be sure to get the Plate resonant first. Typically, I get the preselect in the right range, set the Load and Plate controls to the approximate setting and then rotate to the tune position. I then VERY quickly get the preselect (Tune) peaked and then the Plate peaked, then the Load, and then rotate back off of the tune position. I'll wait a few seconds, then repeat the process, this time starting with the Plate, and getting maximum output, with the second go-around. I have experienced no problems, and no flattening of the finals using this procedure in several hundred hours of use since the total re-alignment by Jeff, 2 years ago. If this is bad advice, I hope someone here posts the better way to do it, so that I can do it properly. Jeff said it was done the way the book states, originally, because most hams, back then, didn't have wattmeters.

Dan,

Thanks for your suggestions. I like the fact that you take a break in the tune-up to let things cool down. That's something I do when tuning my Kenwood TS-520S. By the way, nice shack as shown on QRZ.

1902. collins meter update a very bad day

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-22 14:39:33 UTC
From: Mike Shelly
Topic: 1902 Message: 1902

Well, I found a very nice s meter on e-bay. Put it in and looked like it was going to be fine. When I put in the power connector, I must have nort been in correctley and blew up the radio.

Looks like I blew all the filiments and lamps on the 6.3V line. Must have been off one pin.

I hope thats the only damage. Ordered a complete set of tubes and bulbs.

So warning to all s/line owners be careful the key on the rear plug may be worn or broke and bad things can happen.

Whatever procedure you use to tune up, the very _LAST_ thing you
should do is to make SURE the PLATE current is dipped. This is true of
ANY transmitter with a Pi-Net output.

Whoa there, I am not sure you are saying what you intend to here. _Checking_ that the plate is dipped is a good last step but it should be dipped just as soon as drive is applied. The Drake procedure is a good generic one. Namely, set the load for minimum, Apply a minimum of drive and make sure the driver tank is peaked, adjust the plate tuning for a dip. Increase load and re-dip. increase drive until you reach desired plate current and check the plate tuning and load again. Its important to dip the plate early to prevent the tubes from burning up. That's also the reason for doing preliminaty tuning with minimum drive.

Richard -

OK. I was referring to the previous message(s) that essentially said to
tune for maximum output and go.....

I guess I should have said the _FIRST_ and _LAST_ thing you should
do is dip the PLATE control.

By the way, the Drake transmitters all limit the screen current which
limits the "off resonance" plate current in TUNE mode. Regardless of
the transmitter, the most important thing is to _keep_ the PLATE
current dipped.

Better?

1906. T-4XB Ballanced Modulator Question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-22 21:03:43 UTC
From: Richard Knoppow
Topic: 1906 Message: 1906

I am working on a recently aquired T-4XB. I can't null
the carrier. I think this may be due to a bad diode in the
ring modulator but thought I would ask here if anyone else
had had this problem and if there is a common cause for it.
The balance pot and associated resistor network seems to be
OK and I can get equal amounts of RF at the network output
(checking with a scope and 10X probe). Are there any other
likely culprits than the diodes?

OK, I thought that is probably what you meant. Drake
seems to have done a good job of making their transmitters
foolproof.

Dan,

The reason I'm concerned about the tune up procedure is that in my case, at least, when I tune up the T-4X per the manual, the resultant plate current in the 75m band (around 3925kHz) is 340ma. The manual specifies it should be between 250 and 320ma. Am I running too much plate current?

Probably diodes. These units sometimes develop shorts between diodes
and the wall of the can.

Randy -

Nope, that's fine. Some draw as much as 360 - 400 mA when tuned for maximum output.

Drake issued a "Tuning Alterations" memo to limit the plate current to no more than 340 mA on 160 - 80 - 40 - 20 Meters to comply with revisions to Part 97.73 of the FCC "Purity of Emissions" specification.

Also, the meter shunt (2.7 or 3 ohms @ 1/2W) in these transmitters has a tendency to go up in value with age and/or mistreatment (running Final off-resonance is most common), causing the plate meter to read "high". Aside from misleading the operator about the power he is "really" running, (often the source of the "I'm getting only 30% efficiency with my T-4X(any)". This is no big deal, BUT if the shunt HAS in fact gone up in value, this means the idle current for the PA is also set wrong. This can be serious, because if the idle current is actually set to say 50 mA instead of 70 mA, not only is the dissipation of the PA tubes at idle excessive, the operating point of the stage is also shifted, greatly increasing distortion. So when working on these transmitters, confirm that the meter shunt is what it is supposed to be! Measure it with a good DMM, in-circuit is fine. If it's not within 5% of the marked value, replace it with a 1W ceramic composition resistor. Then measure the actual resistance of the shunt, and then measure the voltage drop across it with the transmitter drawing idle current. Ohms Law will tell you what the REAL current is, and if the meter doesn't read that calculated value, correct it by selecting an appropriate calibration resistor. This resistor is located up on the slide switch centered between the PLATE and LOAD control or behind the LOAD control. This resistor is typically around 200 ohms, but can vary considerably depending upon how accurate your shunt resistor is. Drake only paid less than $1 for this meter, so set it to read accurately at 70 mA as this is the important measurement. It may or may not read 340 mA at 340 mA of actual current, but that is far less important than the idle current.

Gary,

Great stuff. I'll check out the meter shunt asap. I would hate to ruin a pair of $60 finals over a cheap resister. I'll post what I find.

I'm glad you mentioned the resistor. In my T-4XB its
marked 3.3 Ohms but measures about 4.0 Ohms measured
correcting for the lead resistance of the meter. Actually
two different meters. I could re-check it using a bridge but
I think its really off. Time to search for a 3.3 Ohm
resistor.
BTW, since you mention efficiency what sort of
efficiency should I expect for normal operation. That is,
how much power out into a dummy load?
Another observation, my TX seems to put out maximum
power with the load knob at 0, i.e., the load capacitor at
maximum capacitance. The load is is the dummy in a MFJ Versa
Tuner which measures exactly 50 Ohms on DC. Again, is this
normal behavior?
Another also, I took the can off the ring modulator
(very easy to do). I checked the diodes without lifting
them, all seem good, or at least the same. This was done
with the diode check function of a Tektronix DMM-254. The
operation with the can off is the same as with it on. That
is, when I follow the instruction book procedure for nulling
the carrier the output as indicated on the output meter is
rather high and I can't null it. Minimum carrier is with the

adjusting pot all the way CW. Measuring the RF out of the pot I can get exactly equal amounts of RF on the two resistors that feed the ring with the pot somewhere near center. An ohm meter check also shows the pot to be behaving normally. I have not checked the values of the three padding resistors, that's next, but the fact that the RF can be made the same on both sides suggests they can not be far off. I also tried the adjusting cap. It makes a very small difference.
I wonder if there are any other known problems. I will also replace the fixed caps in the circuit if there are no other suggestions.
BTW, the original diodes appear to be low capacitance Germanium types. Has anyone tried Silicon switching diodes? Do they work properly?

All T-4XB documentation shows a 2.7 ohm meter shunt. A 3.3 ohm resistor would be dissipating 0.4W at 350 mA of plate current while a 2.7 only dissipates 0.33W. Even the 2.7 is somewhat under rated. I usually replace them with a 1W "flameproof" wirewound. MUCH more stable over time, but they can be a little hard to find these days. The actual value isn't all that important, since the meter calibration is done with the series resistor. It's interesting because the T-4X used 3.3 ohm and the T-4XC used 3.3 ohm, but the "B" used 2.7 ohm.......
> BTW, since you mention efficiency what sort of

The meter is obviously measuring cathode current, so includes screen current. Typically 50 - 55% of "cathode" power input.
> Another observation, my TX seems to put out maximum

That is typical for the bottom of 80M and 160M. The higher bands usually come out around 4-5 on the LOAD control for a 50 ohm, j0 load.

I suspect you have a leaky cap at C135, OR someone has been spraying
"contact cleaner" crap all over switch S-1C causing enough leakage of DC
to unbalance the "balanced" modulator. You should have NO DC on the AF
input to the BalMod, except in CW or AM modes.
> I wonder if there are any other known problems. I will

Probably OK, see above. Sounds like the RF inputs are balanced.
> BTW, the original diodes appear to be low capacitance
> Germanium types. Has anyone tried Silicon switching diodes?
> Do they work properly?
>

If you must replace them, I'd suggest Schottky diodes such as 1N5711.
That's about the closest we can come to Germanium these days. IN270s
are good, but hard to find.

Thanks you so much, thats all very useful and I will
follow up on it. I am anxious to get this thing on the air.
I was first licensed in the early 1960s and had a lapse of
some thirty years. I got itchy and got an extra-class and
managed to get my original call back.

1917. Re: T-4XB Ballanced Modulator Question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-23 13:09:57 UTC
From: tjb813
Topic: 1906 Message: 1917

I have had the same problem with my T4xB and TR-3. It was strange that I could balance, but not null. Both times I checked the components the same way and found them to be ok. It wound up being a bad cap both times. In the TR-3, it was a small trimmer. I dissassembled it and cleaned it. That worked. In the t4xb it a small fixed cap. With the age of the radio, caps and resistors are mostt suspect.
Good luck, best regards. KD8CN

Grant:

This is a real problem. I would say if it really has to look great, buy another radio. The lettering is the least of your problem. That said, the problem is many of these radios have damaged metal. Cleaning the chassis will not make many of these radios look much better then before they were cleaned. Many have had the copper "bubble up" as the steel below the copper has rusted. Some have tried spraying a copper colored paint over the chassis including me. The look is terrible as the surface looks as rough as the moon. I think it looks worse then no spray at all. It looks cheap. Removing all the parts and having the chassis re-plated is probably out of the question for many obvious reasons. I have often thought about spraying the chassis with a thick self leveling polyurethane and then spraying the chassis with a copper paint coating and then relabeling the chassis with rub on letters supplied by a toy train hobby shop. I have not tried this idea. I am sure doing this will still not make the chassis look great. I can't emphasize enough how bad a chassis will look by just spray painting over the rust. I see no way of sanding the chassis down before a painting as there are too many areas you just can't get to to sand down. Doing all this would really take a lot of time and you would still have a radio not looking all that good.

I have come to the conclusion, the best thing to do is just clean the chassis and live with the situation or get a different radio. Sorry I could not be more helpful. Maybe others know something I do no know.

From: DALE PARFITT
Topic: 1918 Message: 1920

I have to agree on copper chassis cleanup. My only comment would be that instead of dry transfer lettering- one can make water slip decals a lot faster and the look is more professional.
I used this technique on a RX that is pretty much my version of a solid state 2B with a few more bells and whistles- tone control, homebrew xtal filters and an audio notch filter, 160M coverage. The front panel was first primed with gray primer, sprayed with a Gonset grey auto acrylic and then 3 clear coats of auto acrylic followed by wet sanding with 1200 grit. The look is well beyond silk screening and the wet sanding removes any trace of the decal edges.. But I digress.....

From: Bob Spooner
Topic: 1921 Message: 1921

The radio is "almost" working in that the receiver controls all have their intended effect, but the receive sensitivity is very low. When I try to transmit, if the microphone is near the speaker I get feedback. The transmit relay does not pull in. By the symptoms, it seems to be a switching problem, but the 10 volt transmit and receive signals sequence properly. I have used Deoxit on the band switch and on the pins for the plug-in boards, and the power supply board voltages are good. Does anyone have an idea of where to look for the problem?

The copper plating was undoubtedly meant to increase
conductivity at RF (skin effect). I have no idea if this
works but Drake is not the only manuacturer to do it. I

would be cautious of any treatment that might remove much of the copper. There are copper and silver cleaners which remove tarnish, they will probably shine up the surface but, again, be careful not to let them remove much metal and don't use anything with an abrasive in it. I suspect from my Drake stuff that about the best you can do is to remove surface dirt.
BTW, sometimes painting or laquering over corroded metal can cause the corrosion to spread.

This is probably a Yahoo problem. I belong to a couple
of other mailing lists at Yahoo and all have suffered from
this problem occasionally. I don't know the cause. But, its
not just Yahoo, other mailing lists I'm on have also had
problems with repeated messages (usually doubled) at times
(no, its NOT me:-). I looked at the headers and both of
those who complained are on different ISPs. Perhaps, there
is some relay point that is having problems.

Is the synthesizer still locked, ie showing a good frequency? There is
an inhibit line from the synth that can keep the relay from pulling in
if the synth has gone pookie.

Subject: [DrakeRadio] Problem with TR7A

The radio is "almost" working in that the receiver controls all have their intended effect, but the receive sensitivity is very low. When I try to transmit, if the microphone is near the speaker I get feedback. The transmit relay does not pull in. By the symptoms, it seems to be a switching problem, but the 10 volt transmit and receive signals sequence properly. I have used Deoxit on the band switch and on the pins for the plug-in boards, and the power supply board voltages are good. Does anyone have an idea of where to look for the problem?

Larry,

Thanks for your suggestion. The synthesizer is still locked, as far as I could see, since I could hear some signals. The strong ones are quite clear although weak, so I think all the synthesizer circuitry is OK. I'll check the inhibit line though, just to be sure.

Date: 2009-02-24 14:36:20 UTC
From: de_n7ioh
Topic: 1947 Message: 1947

I was just wondering when Drake quit making amateur radio equipment? Also I have found an AC-4 on eBay with a very high serial number that just does not seem right. The serial number is, 86503. In looking at Ron WB4HFN's, Serial Number Database it appears that a serial number around 60639 would be one of the last AC-4's to be produced. Anyone happen to know if sn. 86503 could be a good serial number?

Thanks, Al, n7ioh

Topic: 1918 Message: 1948

Are just 'cleaning up' the chassis or do you want to restore the radio?

To restore, albeit a might pricy, strip the radio chassis down to just the frame. Then go to a commercial sign shop. Have them measure or photograph, etc., all the tube identification lettering...they then can make a silk screen overlay sheet from that info..identical to what is on the chassis. Then, take the chassis to a plater...have them strip the copper and re-plate the copper. Then, take the silk screen overlay and use that to repaint the tube nomenclature on the chassis. (Don't forget to coat the finished chassis with a non-coloring, heat resistant, protective coat, of some sort) Depending on where you live, you will have a couple hundred dollars invested, but...you will have a bright, copper chassis, just like when the radio was new.

Much success on your restoration, if that is your goal.

Subject: [DrakeRadio] Problem with TR7A

The radio is "almost" working in that the receiver controls all have their intended effect, but the receive sensitivity is very low. When I try to transmit, if the microphone is near the speaker I get feedback. The transmit relay does not pull in. By the symptoms, it seems to be a switching problem, but the 10 volt transmit and receive signals sequence properly. I have used Deoxit on the band switch and on the pins for the plug-in boards, and the power supply board voltages are good. Does anyone have an idea of where to look for the problem?

Bob,

The details of the mod depend on which version of the Digital Control board you have. The old version had 9 CMOS logic ICs on it, the new version has four logic ICs and a PROM. I don't have it documented for my web site yet, but you can find a text description in the Drakelist reflector archive or on the Drakelist online forum here:

http://zerobeat.net/drakelist/smf/index.php/topic,226.0.html

Note that this is the old version board. I haven't worked out the mod for the new board yet because I don't have a sample on hand, but the general idea is the same: trick the radio into thinking every band is a "ham band", and to allow transmit outside of the 500 KHz ham segments. I can also forward a pic of the mod to the old style board if you need it.

Al,
I don't know anything about the range on serial numbers on AC-4 power supplies, but I'll bet Drake does. They are still in business making satellite equipment. In my experience, they are usually friendly regarding inquiries about the old ham radio products - they even still sell parts for the R8 receivers, for instance. Send them a note about the AC-4 serial number range, and I would wager that they will respond.

1956. FS: Drake C-Line (T-4XC, R-4C, MS-4, AC-4) in St. Louis, MO

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-25 04:43:18 UTC
From: mecograph
Topic: 1956 Message: 1956

Hi Everyone!

I can't keep all the radios so I've decided to sell my Drake C-Line

Included are the following.

T-4XC transmitter with original (not a copy) Drake manual. Serial No.
21532.
R-4C receiver with original (not a copy) Drake manual. Serial No.
18028. Receiver has the followng accessory filters: 6KHz AM, 500hz CW,
and 250hz CW Filter. Also installed is a 39.1 accessory crystal for
28.0 - 28.5Mhz.
AC-4 Power Supply for the T-4XC. Serial No. 42944
MS-4 Speaker for the R-4C.
All the interconnecting cables (all are original Drake except for one).

Price for all is $750.00 plus shipping.

Here's a web page I put together showing the photos:

http://www.mindspring.com/~vibroplex/drake_c_line.html

I've tried to describe everything that I've discovered about this pair
that's not perfect. I'll do my best to answer your questions although
I'm not an expert on this radio by any means.

Thanks & 73,

Derek WB0TUA

My recently aquired AC-4 appears to be S/N 88920 The
number is rubber stamped on the rear chassis apron and some
of the numerals are slightly smeared and are a bit hard to
read. The second numeral could be a 9 but it looks more like

an 8. I have no idea of its history. I got it from someone on eBay (first time I've ever won an auction there). Are there any other markings I could look for that would be helpful in dating yours?

Thanks Richard, no I was just wondering if the serial numbers really went up that high or if it had been altered. The one I was looking at on eBay had a slightly larger space between the first two numbers then the rest of the numbers. I won't worry about it. Thanks for the reply.

1961. Serial numbers - real, altered or otherwise -

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-25 15:03:45 UTC
From: Kris Merschrod
Topic: 1961 Message: 1961

Has the exact date and place in the production line become so important that we would attach so much interest in the number?

I saw one claim on eBay that the rig was the "last one manufactured." That would be unique - bragging rights of sorts, and, really, that sort of odd case requires research. But for the rest of the cases, the real issue is what the gear looks like, functions, and which components are there. (Would anyone try to make a fake Drake?)

Just glancing at four serial numbers sitting on my desk - I give the Drake company a poor grade on neatness of numbering - not well spaced letters, etc. Fortunately they did nice silk screening where it counts - on the front panels. I assume that they never though of us 40 plus years latter examining the serial numbers for esthetics!!!

73,

Kris KA2OIG Merschrod

Serial numbers are sometimes of practical interest. For
instance where a manufacturer has made significant changes
in the design of a project without indicating it as a model
number change. This was a fairly common practice in two
fields where I have some familiarity, electronics and
cameras. Where there have been no changes in design or only
relatively minor ones, or, where there is no information
about such changes relating them to the serial numbers, such
```

numbers are pretty useless. Drake obviously did not consider serial numbers important or they would have marked them in a more permanent way such as engraving or stamping them into the chassis.
Serial numbers do not always indicate the size of a run or even its order. As an example serial numbers are somtimes issued in blocks. If a production run is not large enough not all the numbers are used and there is a discontinuity in the series. Sometimes, as in the case of late Graflex manufactured cameras, the blocks got mixed so some cameras have duplicate numbers and and many blocks were used out of order. Bausch & Lomb has always been frustrating to me because they evidently issued seperate number series for each product or product group. For instance you can not date camera lenses from the dates associated with the serial numbers of microscope objectives or projection lenses. Somewhere around the mid 1940s B&L changed their whole numbering system to use a prefix indicating the product group and a date code. However, the letters of the date code are arbitrary and there is no key word as there is for Kodak lenses.
Since Drake made relatively few products and evidently did not make significant design changes during production of a given model (or maybe they did?), the serial numbers seem of minor significance. In addition, they do not seem useful even for identifying a particular piece of equipment because they are so easily removed or changed. Nonetheless, serial numbers have an undeniable fascination.

Kris, you missed my reason for wanting to know if it was altered. The AC-3's from what I can tell all had four digit numbers. If someone added another digit it would make it an AC-4 by serial number. The power supply was in the MS-4 so I could not see the supply at all. I requested a photo of the AC-4 because of the serial number and the seller took a photo that showed ONLY the serial number area so I still could not tell what I was bidding on. I could see a very small portion of the upper case but not enough to tell much about it. One would not want to buy a 1969 Mustang unseen and than find out later it was a 1967 Mustang. Serial numbers are important in the Drake line because unlike some items the changes are noted by serial numbers. When things don't look right on eBay or other for sale web sites I don't bid. There are some sellers that will do their best not to tell the whole truth about an item they are selling. They play dumb, won't tell you that there is something wrong with it even though they know about the problem. They claim it worked fine the last time I used it or any number of stories to avoid telling the truth. In this case it looked like the seller knew something wasn't right and was trying to hide it.

Richard -

Serial numbers are significant in some Drake equipment. The TR series of tube transceivers had 14 different "versions" over the years, there were two versions of the TR-3, eight of the TR-4 and four of the TR-4C. There were four versions of the R-4B and four of the R-4C. Unfortunately Drake was not "iron-clad" as far as the hardware reflecting the exact version according to serial number ranges. Certain circuit/component changes actually occurred a little on either side of the "official" documented change s/n.

The receivers in the 4 Line started at 0, and went through the R-4C "continuously" through nearly 30,000. The transmitters started at 10,000 (T-4 started at 100, I think) and also went through about 30,000.

All that being said, the AC-4 power supply didn't have enough changes made to matter functionally. Some just want to own the "latest" serial number unit. Others think that the later s/n units will have more "life" in the electrolytics! The problem here is that ALL these supplies are at least 30 years old, so the caps are at least 20 years past their expected life.....

Ah, Al, now I see what the issue was - My AC-3 to AC-4 experience is limited to only a few pwr splys, but from that experience the AC-3 did not have an aluminum cover, while my AC-4s all have had covers (even in the MS-4). But then again, my AC-4s are late 1970s.

I'm off to a hamfest this weekend and will look over those pwr splys!

Kris -

All AC-4 power supplies had a top cover, NONE of the AC-3 supplies did. There were two versions of the AC-3, one with a large filter choke about 1/3 the size of the power transformer and no filter caps on top of the chassis, and another with no choke and several Twist-Lok style filter caps.

I think the only changes on the AC-4 were to increase the capacitance of the Bias Supply filter caps, and the addition of a slide switch to convert from 120 to 240 VAC operation. I believe that all had dual primary power transformers, but for most to change from 120 to 240 required wiring changes on a terminal strip.

1968. T-4X No CW

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-26 02:37:10 UTC
From: Randy
Topic: 1968 Message: 1968

I'm working on a T-4X and do not seem to have any CW. Here's the story: On 75/80m band (around 3900kHz), the rig tunes up fine following the procedure in the manual. Here are some numbers:
Idle current = 70ma
Plate current in the tune function = 280ma
Resultant power into 50 ohm dummy load = 130W

So far, so good. At this point I wanted to check the Carrier Balance and this is where the problems started. Per the manual I set the sideband to lower, turned the GAIN all the way down (CCW) and turned the FUNCTION switch to CW. The plate current started to rise to maybe 120ma at which point there was a click (like a relay operating) and the plate current dropped to zero; all this in a few tenths of a second. Switching back to the TUNE position results in 130W as shown above. Back to CW and again 120ma, then zero plate current. There is no key in the key jack at this point, meaning that the grids of V3 and V4 are pulled to ground via the key jack contact.

I confess, although this is not my first tube transmitter, it's my first Drake and it's obvious that I don't understand the CW operation. It seems that with the Function switch in CW and sideband on LOWER and no key in the key jack that the radio should be transmitting, except that the instructions say to turn the gain all the way down, so power would be zero. In that case, how can one adjust the power meter for full scale indication? Any help would be appreciated.

Randy - K8HRO

1969. Re: [DrakeRadio] T-4X No CW

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-02-26 03:19:06 UTC
From: Garey Barrell
Topic: 1968 Message: 1969

Randy -

Couple of problems....

1. Either your wattmeter is overly optimistic, or the plate meter in the transmitter is reading very low, or both. Normal plate current for 130W output in TUNE is closer to 350 mA.

2. Carrier balance is checked in SSB, not CW.

From your description, it sounds like the transmitter and VOX circuitry are working properly in TUNE mode. When you switch to CW, the only difference is that the sidetone, which is also used to operate the VOX circuit and therefore the T/R relay, is not making it through the CW switch. In CW mode, the Sidetone is switched on and off when keyed by biasing D8, which is a diode to ground between the two sections of V9. The sidetone is generated in V9a and capacitively coupled to V9b. Diode D8 is either forward biased when the KEY is UP, bypassing the sidetone to ground, or reverse biased when the key is down, allowing the sidetone to pass through to the MIC AMP and on to the VOX. There is an R/C network that provides a pulse when the KEY is first closed to yank the relay closed quickly to prevent clipping of the first syllable or code element, and that is what you are hearing. The pulse is pulling in the relay, allowing final plate current to flow, but since the sidetone is not there to keep it closed, the relay just drops out again.

The positive voltage which is intended to cut off diode D8 comes via R66 and R67, which are both 22M, 1/2W resistors. These tend to go up in value with age until there just isn't enough voltage available to cut off that diode and allow the sidetone to pass. Another less likely possibility is that D8 has failed shorted, which would have the same effect.

Oops, up too late.

Cancel the "shorted diode" idea. That would kill the TUNE mode as well.

Are you keying at the mic jack? The instructions are to
short the center pin of the mic jack to ground to key the
transmitter. The brief operation followed by the relay may
be the VOX coming on for a fraction of a second.

Subject: [DrakeRadio] Problem with TR7A

The radio is "almost" working in that the receiver controls all have their
intended effect, but the receive sensitivity is very low. When I try to
transmit, if the microphone is near the speaker I get feedback. The transmit
relay does not pull in. By the symptoms, it seems to be a switching problem,
but the 10 volt transmit and receive signals sequence properly. I have used
Deoxit on the band switch and on the pins for the plug-in boards, and the
power supply board voltages are good. Does anyone have an idea of where to
look for the problem?

>to do this mod?

Bob,

The details of the mod depend on which version of the Digital Control board you have. The old version had 9 CMOS logic ICs on it, the new version has four logic ICs and a PROM. I don't have it documented for my web site yet, but you can find a text description in the Drakelist reflector archive or on the Drakelist online forum here:

http://zerobeat.
<http://zerobeat.net/drakelist/smf/index.php/topic,226.0.html>
net/drakelist/smf/index.php/topic,226.0.html

Note that this is the old version board. I haven't worked out the mod for the new board yet because I don't have a sample on hand, but the general idea is the same: trick the radio into thinking every band is a "ham band", and to allow transmit outside of the 500 KHz ham segments. I can also forward a pic of the mod to the old style board if you need it.

Unique supplemental service information CDs available for the Drake TR-4, TR-4C/Cw/CwRIT, B and C Lines and the 2-B receiver.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.

While high resolution scans of the original manuals ARE on the CDs, what they really offer is high resolution color photos of the under chassis and individual PC boards of each unit with all parts identified and keyed to a parts list. This information is not available elsewhere and really makes a difference in servicing these units. Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

Joe,

One thing you might want for RTTY is the power amplifier mod that adds a small amount of emitter resistance to help prevent thermal runaway.

I would also not run more than about 80Watts out.
You can use the same soundcard interface as you would for psk. several out there you can buy, or make your own if your computer has a serial port.
Lot of software out there as well. Lately I have been using Airlink express.
works with vista as well as older os's.
Good luck !

I assume you mean the predriver mod, which only applies to the version 2 predriver board. I've done this to two radios so far, and it seems to work as advertised. It is described in DrakeMods 6 and on WB4HFN/s web site.

Also highly recommended is the FA7 (or equivalent) cooling fan - for ANY mode of operation. Properly installed, it can enhance the overall stability of the radio as well as keep the PA cool.

Regarding a fan on the TR7: Quite a while back I switched to a 12VDC fan controlled by a thermistor mounted on the final heat sync. The turn-on temperature is adjustable via a small pot and the fan runs only when it needs to. Sure makes a big difference in overall noise. I tried two different circuits in the 2 TR7s I had - one was a small board from FAR circuits and the other was from a Ham Radio article. The small PC board in both cases mounts where the 110VAC socket was originally, and the pot is accessed through that opening. If anyone is interested, I can post more info.

Hi Floyd,

The thing that bothers me about the idea of a thermostatically controlled fan is temperature variation inside the radio - especially in the PTO area. My experiments with a standard FA7 showed that, properly oriented blowing out, the fan kept the whole radio at a more stable temperature over T/R cycles. I would think that a thermostatically controlled fan would make this less so. Have you done any experiments with temperature probes to see what happens?

1986. Another TR-4 Question ...

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-03-03 04:15:17 UTC
From: kd7bwb
Topic: 1986 Message: 1986

Hello folks, I'm a new Drake TR-4 owner, so bear with me. I acquired a working TR-4 about 10 days ago, and it worked fine for about 2 days.

Then it stopped tuning up in transmit (but bias current is read on the plate-current meter),
and the S-Meter pins to the right, whenever the transceiver is placed in tuneup CWx mode.

Advice I received so far, range from sticky relay and tube-pin-connections, to one of the dual-triodes has gone unbalanced. I think maybe V18 is one-side dead, but that's just a guess. Am I all wet?

Thanks all!

The best advise I can give you is the first thing I would do is secure all the tubes maybe even clen the contacts. Then I would make sure the relay is plugged in correctly (if a plug in relay). Then I would clean all the controls and give the unit a good look over with a bright light (*CSI style hi hi).

Also check the power supply connections and adjust the bias voltage. If you don't have a manual GET ONE! You may find a free copy on the Internet.

I feel your pain. I just got a T-4xc and didn't power up right away so the above is a very good start as easy as it sounds. Good luck! If I can fix my Collins 75s-1 RX that I just blew up I hope to chat on air wid you.

Paul -

Check to see if V15 is lit. If it is, check voltages on this stage.
Check R53 and R76.

To Mike WB2KKI,

Thanks muchly for the commentary. I've already done most of that.
I've even gone to the trouble of doing the AC-4 mod circuit board from
'heathkit.com' (just to clear that problem from the list of things to
check; now getting good voltage, and the mild hum prior to the update
is now gone). Bias was set before I even turned the radio on the first
time I got it home (it'sa good idear anytime the radio/PS gets moved).

I'll keep at it though <grin>!

1991. FS-4 Coax cable

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-03-04 00:25:55 UTC
From: Greg
Topic: 1991 Message: 1991

I have an old FS-4 that I use on my R-CO but the 12" jumper cable that came with the FS-4 just isn't long enough to allow me to place the FS-4 where I would like it. Just wondering if this is "special cable" or will just any shielded wire will work. I would like to make a new jumper approx 24 inches in length. Has anyone done this and did it create any problems?

Thanks,
Greg W8NGA

To Garey K4OAH,

I have checked and substituted the V15, and it's good. R53 looks like it is attached to T11 (r53-1.5kohm) and R76 causes some confusions as there appears to be two(2) R76 resistors. One is a 100-ohm attached to the balanced modulator diode bridge (d1-d4), while the other is attached (thru R51) to V11 and is 1.5-kohm.

I assume you mean the R76 at the balanced modulator?

Sorry this is taking a while, but I'm a working guy. Plus, I haven't read a tube schematic in 30-years+ <grin>!

Paul -

Yep, there are TWO R76s in "some" TR-4s.

You might want to make sure you have the correct schematic before you tear out too much hair, there were eight (8) versions, and some of the changes were in the S-Meter circuitry.

I suggested V15, because V15 and V11 combined plate currents are balanced in the S-Meter bridge against the plate current of V17 in most units. I was just guessing based on your "pegged S-Meter" comment.

I'm wondering if any group members that operate a T-4X do so in the AM mode, and if so, what kind of audio reports do you get? It's my understanding that the controlled carrier screen modulation used by Drake in these transmitters is not the best and can often be severely overdriven and as a result, distorted.

Follow the tune up procedure as noted in the manual. Adjust the mic gain accordingly, on air reports will help. The T4X will produce controlled carrier AM which will result in a "bump" upward on the receiver but not bad. Use the T4X with an amp and this will not only increase the signal at the receiving end but reduce the upward indication on the receivers S-meter. As for audio, the Drake as well as many other controlled carrier AM modulators sound very good to excellent. I've used mine many many times and copied audio from many stations
using this mode. It works very well with good audio.

From: Jim Jacobs
Topic: 1997 Message: 1997

a couple of months ago i purchased a lot of ham radio items from a long ago past estate, this drake L4 amplifier along with the power supply was put away in a steel cabinet in 1976 and was there untill i purchased it a couple of months back, has not been powered up, or tried at all, , just like the day it was put away, i bought it from grandson, who never got his ham license like he thought he would, i have the tr4x transmitter and its power supply to, also just as the day it was purchased, both the amp and transmitter never had any work, modifications or anything done to them, very good shape,
i am a cb guy and i am not going to use this amp as its way to nice for using it for that, was wondering if anyone in the group might be intersted in purchasing or have something to trade,
just want fair price or something of equal trade, this equipment is very nice, but you will have to do what ever is necessary after sitting this long,,,, contact me at jacobs132@yahoo.com or my cell, 908-278-2350, my name is jim, i just want this stuff goe to some one who can use it for its collector quality and intended use

No -haven't done any temperature measurements. I keep the fan turn-on temperature rather low, and I don't use the PTO - only a DDS VFO with the TR7.

The June, 1994 issue of QST contained one of the articles: "An Automatic Temperature-controlled Fan", on page 41. The info is copyrighted and can't be uploaded to this site, but is available as a PDF file for free to ARRL members at the ARRL website.

The second article titled: "Improving the Drake TR-7" was published in the Summer, 1992 edition of Communications Quarterly. That article described a number of major mods to the TR7, but included the rather simple fan control mod. It's a circuit similar to the QST article and the circuit boards are available from FAR circuits - here's the link: http://www.farcircuits.net/tr71.htm .
The advantage of getting the article and board from FAR is that the article shows you how to mount the board in the space occupied by the AC socket.

One thing I've found important with either of these mods is to enclose the thermistor in a metal housing with some mass. That prevents the fan from cycling on and off while cooling by isolating the thermistor to some degree. In my case, I epoxied the thermistor into a 3/4" piece of 1/8" copper tubing and glued that to the heat sinc with some black hi-temp silicone sealant. I've installed the same circuit in the PS7, mounting the thermistor to one of the heat sinks with silicone.

Tim,
I'm just curious, but what type of amp do you run with your T-4X?

I also see you're from around the Saginaw area. Perhaps we could have a QSO on 75m sometime. I'm on most every afternoon at 1700ET on 3921kHz. It's called the Michigan Upper Peninsula Net. Check in if you'd like and maybe we could hook up after the net.

Thanks for the info and the links. The cycling you mentioned I have experienced with computer fans that were thermistor controlled. I like the way you mounted yours to solve that. Thanks !!

The June, 1994 issue of QST contained one of the articles: "An Automatic Temperature-controlled Fan", on page 41. The info is copyrighted and can't be uploaded to this site, but is available as a PDF file for free to ARRL members at the ARRL website.

The second article titled: "Improving the Drake TR-7" was published in the Summer, 1992 edition of Communications Quarterly. That article described a number of major mods to the TR7, but included the rather simple fan control mod. It's a circuit similar to the QST article and the circuit boards are available from FAR circuits - here's the link: http://www.farcircuits.net/tr71.htm .
The advantage of getting the article and board from FAR is that the article shows you how to mount the board in the space occupied by the AC socket.

One thing I've found important with either of these mods is to enclose the thermistor in a metal housing with some mass. That prevents the fan from cycling on and off while cooling by isolating the thermistor to some degree. In my case, I epoxied the thermistor into a 3/4" piece of 1/8" copper tubing and glued that to the heat sinc with some black hi-temp silicone sealant. I've installed the same circuit in the PS7, mounting the thermistor to one of the heat sinks with silicone.

It's my understanding that the controlled carrier screen modulation used by Drake in these transmitters is not the best and can often be severely overdriven and as a result, distorted.

This is true of pretty much any vintage AM transmitter, as they offer
no ALC or overmod control. It's up to the operator to keep things down
to a dull roar. I've used my T-4XC on AM exactly once, and the audio
report was good.

Ah, that explains it (showoff... :)). I did think about the
thermostatic fan idea myself, but based on my crude experiments with
PTO temps, I decided just to leave the fan run all the time.

The TR-4B has peak limiting on the audio, I assume the
TR-4C must also have audio AGC. My B seems to control levels
quite well. It prevents flat-topping on SSB and should avoid
overmodulation on AM.
Also, I don't know what you mean by "vintage" but older
transmitters than the Drake have ALC and/or audio
compression. The Collins KWS-1 and the S- line are examples.

The ALC in all of the T-4X / TR-4 transmitters is at RF. There is NO
ALC on either CW or AM, and you can seriously overmodulate on AM.

Peak limiting ALC on SSB only. No control on AM. Perhaps there are some
AM transmitter designs that have some form of compression or limiting,
but not those that I have seen. Even CB radios for the most part didn't
have AM mod limiting until the FCC made them put it in.

Hi Randy

I use either the L4B or the L7 with the Drake xmiiter.

It would be great to have a qso, I operate a good deal of AM phone on 3.880 or 3.885 or we could make a sked. I will also check into the UP net, I've done this from time to time as well..

Tim,

I'm just curious, but what type of amp do you run with your T-4X?

I also see you're from around the Saginaw area. Perhaps we could have a QSO on 75m sometime. I'm on most every afternoon at 1700ET on 3921kHz. It's called the Michigan Upper Peninsula Net. Check in if you'd like and maybe we could hook up after the net.

>

> Follow the tune up procedure as noted in the manual. Adjust the mic gain accordingly, on air reports will help. The T4X will produce controlled carrier AM which will result in a "bump" upward on the receiver but not bad. Use the T4X with an amp and this will not only increase the signal at the receiving end but reduce the upward indication on the receivers S-meter. As for audio, the Drake as well as many other controlled carrier AM modulators sound very good to excellent. I've used mine many many times and copied audio from many stations

a couple of months ago i purchased a lot of ham radio items from a long ago past estate, this drake L4 amplifier along with the power supply was put away in a steel cabinet in 1976 and was there untill i purchased it a couple of months back, has not been powered up, or tried at all, , just like the day it was put away, i bought it from grandson, who never got his ham license like he thought he would, i have the tr4x transmitter and its power supply to, also just as the day it was purchased, both the amp and transmitter never had any work, modifications or anything done to them, very good shape,

i am a cb guy and i am not going to use this amp as its way to nice for using it for that, was wondering if anyone in the group might be intersted in purchasing or have something to trade,

just want fair price or something of equal trade, this equipment is very nice, but you will have to do what ever is necessary after sitting this long,,,, contact me at jacobs132@yahoo. com or my cell, 908-278-2350, my name is jim, i just want this stuff goe to some one who can use it for its collector quality and intended use

Well, if you are saying that NO commercial AM
transmitter had any sort of limiting check the famous
Collins KW-1 which had a clipper built in. Not quite the
same thing as a dynamic gain control but a limiter
nontheless.
I will have to examine the schematics for my T-4B again,
I thought the limiter worked on audio.

What you wrote was:

Perhaps there are some
AM transmitter designs that have some form of compression or
limiting,
but not those that I have seen. Even CB radios for the most
part didn't
have AM mod limiting until the FCC made them put it in.

I just pointed out a single commercial design that did
have "some form" of compression or limiting granted that a
peak clipper is a pretty crude limiter.

I am not arguing about the Drake and especially not about
the T-4C since I have not been in one. If it has RF limiting
that would not prevent AM overmodulating, an _audio_ limiter
would, I don't think we are arguing about that. You have put
a doubt in my mind about what exactly both transmitters have
in them. I will have to trace out the schematics.

very good condition drake l4 amplifier and power supply, , put away in a steel cabinet when owner passed in 1976 and not powered up since, all original, unmolested collector quality, taking offers for it, i am a cb person, i just dont want to use this amp for 11 meters, should go to a drake ham guy, , i took cover off of amp to see what condition every thing appeared and all looks nice, 2 3-400z's says amperex 8163 on tubes.
i am open to trades to, let me know, i do not have the capability to use this also because no 220 outlets in our rental home and a already over taxed 110 circuit, this not another ebay like story,

I did buy the TR-7 today and it's working ok; have made several cw qso's on 40m. I posted a message yesterday about 17 & 12m. There was no manual with the rig so I went to WB4HFN's Drake page and looked at a manual and plan on printing one later. Now unless I'm mistaken I need the AUX-7 board, correct? If not the case can someone explain how to get it to work on 17 & 12m?

Thanks.

You do not need the AUX7 board, that just makes it handy. There are a couple of methods. One is the "allband transmit mod", which will enable transmit on all the 500 KHz segments accessible with the Up/Down pushbottons (except below about 1.7 MHz). Your radio may already have this. The common method of doing this is to cut a trace on the bottom of the parent board, as mentioned by N9WW on WB4HFN's web site; this is bad, even though this mod was published by Drake. The reason it is bad is it effectively disables a control signal that will inhibit transmit if the PLL circuit goes out of lock. It also prevents the addition of a worthwhile modification published by GW4ALG that eliminates a transmit spike that can occur in the TR7 when first powered on. I've worked out a better allband transmit mod that does not disable the out of lock signal, details available on request.

The other method is to add some diodes to the bottom of the parent board to "fake" an AUX7. Details are on the Drake Museum website and (I believe) the Drakelist website, among others. There is also an eBay seller offering these as a kit. For convenience sake, this is probably the way to go, and it will save wear and tear on the Up/Down buttons. You can also add 0-1.5 MHz coverage with this method, but doing both at the same time requires a lot of diodes in a small space, and gets hairy. It's also possible to homebrew an AUX7, there's a good article on WB4HFN on one way to do it. It's just diodes and connectors.

I believe the owner's manual is also available on several web sites, WB4HFN, mods.dk, and others. A low-res copy of the service manual is also floating around for free download, or you can buy a good hi-res version from Hamanuals or on eBay. The Hamanuals version has a hyperlinked index, which is really handy, but does not cover all the later revisions. There is a wealth of information on the internet on the Drake stuff, use Google and you will be surprised what you turn up. Just about any question you might have can probably be answered by searching the Drakelist archive.

The following request is reposted to the general readership for W1FU.
(Joe-WA6RKN, Ass't Moderator)

****

Gentlemen,

I am a newbie to the group and could sure use some help.

I recently picked up an old r4A and t4x, both in reasonable condition, and cleaned up pretty nicely.

However, the big problem is that the green , red, and black striped wires from the vfo are disconnected from radio,it looks like it was removed for cleaning or something. Anyway, here is my problem, the drake r4A book and schematic appear to be different from the radio itself. Even the underside picture (in my book) shows the vfo wires going to a small board under the audio board. My radio does not have this "extra" little board. It doesn't appear that it was removed, or that there has been any "mods" to it. Schematic is differnt from radio.

Where there changes in the design in the r4A's as they evolved?

My r4A serial # 6899
schematic drawing : 1026665400

Sure could use some help finding out where to connect VFO AND WOULD APPRECIATE IT GREATLY.

Thanks,
Ed

Ed -

There are four versions of the R-4A, and that is the correct
schematic. You have a Version 4, the last one before the R-4B.

Drake didn't always change the manual when changes were made in the
hardware. They used the original manual, including the photos, (and
Voltage / Resistance charts,) and just changed the schematic.

Attached is a photo of the PTO / Audio Board area. The White/Red wire
is the DC power, White/Black is Ground, and White/Green is RF Out.

Date: 2009-03-15 03:07:36 UTC
From: wa4zzw
Topic: 2028 Message: 2028

I bought a late model TR4 at a ham fest recently.
The receive seems to work but I get no drive on transmit.
I can see no output with a scope at the plate of V4 but I do see signal on the grid.
I have plate and screen voltage and a little cathode voltage.

Also does the sideband switch seems strange but maybe its normal.
For example when switching from 80 to 40 meters the indicator lamp goes from Lower to Upper.
Thanks,
Bob WA4ZZW
Decatur, AL

Bob -

The original is an Erie 557 series ceramic trimmer, 8-50 pF, N750. It was only used in the TR-3 and very early TR-4 transceivers, but was used in almost all of the T-4X/A/B series transmitters.

Surplus Sales of Nebraska has the trimmer, but I don't know if it is N750 or not, or just how critical that might be. I've never had to replace one, the couple that have given trouble have been repairable by disassembling and cleaning. Your best bet would be one from a parts unit if you can find one. There just aren't many parts units around because they can almost always be repaired!

That may work. These are the "D" shaped phenolic with two mounting
holes, and the round ceramic "button" held in by the "tripod", just like
the Collins caps.

If they fit, the N500 is certainly closer than an NP0 ! :-)

Vic -

It's _PROBABLY_ an easy fix. There is a ball bearing race at the front of the PTO "gearbox" that supports the main shaft. This bearing is loaded by a single ball at the rear of the shaft that has an allen-head setscrew at the rear of the gearbox. Could be simply an adjustment of this screw. Set too loose, the front shaft wobbles and allows lateral movement of the MAIN TUNING knob. In extreme cases one of more of the balls in the front bearing fall out and then it's REALLY wobbly! :-) Still, easy fix as the balls are standard 0.125" steel balls.

By the way, the PTO is "Direct Drive", all the gearing is just to drive the dial plates.

A rare find indeed. I've got the inside half of a CS-7, which is
usually all that you find.

The manual for the CS-7 is available on the net for download, either at
mods.dk or one of the many Drake-related web sites. It likely uses the
same hardware.

Hi Gare et al,
While I do have some of the ceramic phenolic, none are negative temps and are low value. The phenolic/ceramic have a 0.3" hole-hole spacing while the all ceramic (of which I have many more) are 0.45 center-center and slightly larger overall.
If one of these will suffice- all I require is a couple dollars to cover mailing in a padded envelope.

Dale -

OK. These are the 0.3" hole spacing. I just looked at a TR-3, and the same trimmer cap is used in the crystal calibrator, so that's another possible source. If nothing else he can pull the one from the calibrator and use it for the Carrier Oscillator until he can find another one!

Just purchased a TR-7 and like the rig very much. I have asked and received advice on how to get rig to work on WARC bands and 60m. What I'd like to know from the group is what is the best route to do this - getting AUX-7 board or cutting the trace under the parent board. Pros? Cons? Any info will help. I am also looking for a Drake 7077 mic with 4 pin connector...does anyone out there have one they no longer use? I will appreciate any info and BTW an excellent article in the April issue of QST on updating the TR-7 to make it equal with today's rigs.

Don't cut the trace. This is a BAD mod, for reaons I previously described. Transmit on all bands except for 2.5 and 5.0 MHz (60 Meters) can be accomplished with a simple mod on the DR7 board as described by GW4ALG here:

http://www.alg.myzen.co.uk/radio/tr7/mods.htm#15

This mod preserves the Out-Of_Lock signal from the VCO, which is a desirable thing. You get to the desired band segments by using the up/down pushbuttons, just as before. The only difference is you can transmit there as well, after the mod.

If 60 meter coverage is desired, two simple cuts to the Digital Control board under the DR7, in lieu of the GW4ALG mod above, will do it without disabling the OOL signal. You will find a discussion of that here:

http://zerobeat.net/drakelist/smf/index.php/topic,226.0.html

If price is no object, you can purchase an AUX7. They do show up on the 'bay, but are horribly overpriced for what they are (IMO). There is no real advantage to a real AUX7 unless you want the option for fixed crystal-controlled channels. You can easily build one (without the crystal sockets and associated parts) very inexpensively, as described here:

http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/AUX-7%20board.pdf

Again, DON'T cut that trace on the parent board. I can't imagine what Drake was thinking when they came up with that mod. The reason for the OOL inhibit is to keep you from unknowingly transmitting out of band, and potentially interfering with other services, if the PLL circuit fails to lock for some reason. There may also be the potential for damage to the PA and TX filters, depending on where the transmit signal lands. There is a better way.

Jim,

Doesn't 60 meters specifically forbid vfo coverage and must be "channelized" and usb in order to be legal? If that is the case then the TR7 would not follow the rules (channelized) if modified for general coverage transmit. Also isn't the 5.0 mhz band a forbidden portion for the TR7 due to IF's in that range? I was thinking I had seen a link to a homebrewe version of the AUX7 but your link to
http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/AUX-7%20board.pdf
was the version I had seen.
Even if you had an Aux7, where would you get custom ground crystals these days? I have tried to deal with International and given up. Jan is there but their web site is not the best.

Thank you.

60 Meters is channelized, but only in the sense that you are only permitted to operate on the four authorized frequencies. I believe the wording is something like "centered on" such-and-such. If you look at the ARRL ham band chart that is available for download, they give you the center channel frequency and the specific frequency that you must tune your VFO to in order to be centered on the required channel. The Icom chart that I have handy gives the same information.

>Also isn't the 5.0 mhz band a forbidden portion for the TR7 due to IF's in
>that range?

I think that's true of the 4-line rigs, but I just checked the AUX7 instruction brochure - there is no prohibition on transmit in the 5.0 MHz band. I presume this is due to the upconversion and the tight shielding of the radio, although there might still be certian discreet frequencies that could be problematic.

>Even if you had an Aux7, where would you get custom ground crystals these
>days? I have tried to deal with International and given up. Jan is there
>but their web site is not the best.

I don't see why that would be a problem, the exact specs to cut the crystals are in the AUX7 instructions, as are instructions for calculating the crystal frequency. I don't think I've ever heard of anyone actually doing it, though. I could see it being convenient if you were running a regular net, or perhaps for convenience on 60 Meters.

Now that you have me thinking crazy thoughts, I can see running the control lines outside the radio and building a "Super-AUX" box with as many band positions and/or crystal sockets as you wanted. Or a box with a mondo rotary switch (or rotary chopper feeding a PIC) that would step you in 500 KHz steps from 0 to 29.5. You could even eliminate the bandswitch entirely and have relays control the filters, just like the rice boxes. That would be cool...

I missed this comment. I don't get QST. Equal in what way? The reciever is already superior to most "modern" rigs, the tranmitter is bulletproof and has stellar audio. What more can a ham ask for? :)

From: john baker
Topic: 2044 Message: 2044

Hi guys,
Has anyone tried to operate multiple radios with the same power supply (AC4), not at the same time, of course? With limited desk space, I was thinking of making a 'Y' adapter to connect two 4 series rigs to a single AC4. Extension would be the second benifit. My concern would be that, even though one rig would be switched off, there would be malacious voltage into it while operating the other. Would the off radio circuits be protected or would this be something like using a splitter instead of a duplexer on an antenna?

...likewise with splitting the MS4 speaker between two rigs.

I am afraid I don't have that much confidence in my electronics skills yet, nor the time to develop them properly.

God bless

Mike -

Is that relay still working?? That looks to be a severe overload on the 6EV7 relay tube. The tube data specifies a 2500 ohm relay coil, and all the other Drake transmitters use a 48VDC relay, which is about 1800 ohms, with an additional series resistor of 1500 ohms.

I'd suggest a P&B / TYCO KA-14DG-48, would be a better choice. Unfortunately, relays of this type are an endangered species, with BIG prices.

Drake offered a small PC board to mount the plug-in relay used in the T-4XC and TR-4C. John Kriner had some of those, but I don't think he has them any more. That relay is only about $15. May be time to make another run of boards!

Mike -

Hard to argue with the source.... Or success! :-) However.....

You're exceeding the MAX cathode current of the 6EV7 by a factor of at least two. According to the original Voltage chart, the original relay drops 50V across the relay coil, with 200V on the plate. IF the original relay coil was in fact 470 ohms, that's five times the MAX cathode current for a 6EV7 (22 mA), and twice the specified current for the relay coil (51 mA).

I still say it should be a 48VDC coil, as in the T-4XC. That means a 2500 ohm coil, plus the 1500 ohm resistor, for 20 ma current. This is well within the max current rating for the relay (28 mA) and the 6EV7 (22 mA).

Of course all of this only matters when in transmit, maybe you're just a man of few words!! :-)

Bob -

First, I would recommend disconnecting the RV-4. No point in further confusing the issue! You WILL need to jumper Pins 2 and 8 of the RV connector while the RV-4 is disconnected.

The S-Meter is a bridge network that compares the current drawn by V17, the AF Output tube, with the current drawn by V11 and V15. I'd start by checking the resistance values around V17, particularly Pins 2 and 5 to ground, C135 for possible short with voltage applied, C134, R53 and R76.

Topic: 2054 Message: 2055

In the past year, I've purchased crystals from International Crystal in Oklahoma City for both Drake and Heathkit equipment. The last crystals I bought a few months ago were $20.95 each, plus a little for postage, and they have a lifetime guarantee.

Their number is 1-800-725-1426. They have all the specs, so you just need to tell 'em the RX model and crystal frequency.

2056. HELP!

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-03-22 00:34:10 UTC
From: david.rose@snet.net
Topic: 182 Message: 2056

Just got my AUX-7 board all set up for the WARC bands and went to install the board, but to my suprise it looks more complicated than I thought. Is there an easier way to do this w/o dropping the front panel and possibly damaging the bandswitch? Any advice always appreciated. Tnx.

>
>Dave KW1V

David,

Although dropping the front panel is not that difficult, that is not the correct way. To install the AUX7, you need to remove the DR7 board. The Drake installation instructions are available on various web sites around the net, and be sure to read the cautions and caveats involves with removing and reinstalling the DR7 board which have been posted fairly often here, and in the Drakelist reflector archive.

And please, give us some feedback on how you are doing. Several of us have taken the time to answer your questions and offer help, but it feels a bit like typing into a vacuum without seeing any feedback that you have even read this stuff.

I agree with Jim. International is great. They've ground many crystals
for me; Drake, Collins, Hallicrafters, they can do it all.
Joe.

I went through all 20 tubes and found some deviations from expected resistances. V-11 pin 7 rated at 45 ohms, actual resistance is 45,000 ohms. V-15 pin 1 rated at 1 Mohms reads 2 Mohms. V-18 pin 1 rated at 180k, actual is 360k. V-19 pin 2 rated at 4.4 megs, actual is 10 megs.
I am not leaving power supply on for more than a few seconds as S-meter pegs out, did notice that meter stays pegged for a few seconds after power supply is turned off and slowly drops as if capacitors are discharging. Also no lights for meters, tuner light or upper/lower sideband indicator. Clipped C-135 and checked, rated at 10mfd, read 12mfd. I'm an HVAC tech. Monday through Friday trying to be a radio tech. on weekends so any and all help is appreciated. I love a challenge. Thanks, Bob KC9MTW

OK. Strange as it may seem, the only measurement you made that may be significant is the first one. Assuming you made these tests as specified, (receiver off, power supply disconnected,) V11 Pin 7 _should_ have a 100 ohm resistor going to the "RCVR CATH" line, which _should_ be grounded via a n.c. relay contact on the T/R relay. This discrepancy WOULD make your S-Meter peg. So your next task is to find R50, connected to Pin 7 of V11. It should be a 100 ohm, 1/2W resistor, and the "other end" should be at chassis ground. Pin 7 of V12 is also connected to this bus, and since it's resistance is OK, the problem is most likely with R50 or its connections.

As for the lights, there is a slide switch on the back panel of the chassis that either shorts a 68 ohm, 1W resistor or puts it in series with the panel lamps to dim them. Usually NO lights is an indication of the slide switch contacts being corroded. Try "exercising" this switch several times to see if that lights the lamps.

By the way, there are at least two versions of the TR-3, what is the s/n on yours so we have the right schematic?

Thanks to the group for this information. I emailed them for a
quote, and got a response immediately. One phone call and the
crystals are on order, the sales rep was VERY helpful, and knew the
Drake product line. Highly recommended.

Perhaps someone has replied off-line on this..but here is my take:

If voltages appear at the inlet to a T4 for instance, it is going to be ON. The only thing that is switched inside, is the contacts for the 110VAC line in to the PS. Whether or not that switch is on or off, if you put the other voltages on the inlet pins with a Y adapter, the unit is going to be in the ON condition.

If you want to use a Y adapter--easiest to just unplug the one you're not using--otherwise, each of those lines needs to be switched.

Cant speak for the TR series but I assume it is similar to the T4's

Thanks Curt
I did get a reply back channel as well. Thank you. That was kind of what I figured. My concern now is that, if I build a switchbox, will I cause any problems by just switching the power conductors. If all the other lines in the cables are split and just the power conductors were switched would there be any destructive feed to the rigs not switched on? This would also include the feedlines for the MS4 speaker. From what I can tell at this point, it should work safely but I am not convinced yet.

I'm suprised that, with all the experience on here, someone hasn't tried something like this yet. I have four different rigs (set of B twins, TR4, T4xc and a TR6) and not much shelf space. It would be very user friendly to not have to pull out each of the rigs I am switching from and to each time I want to switch. That won't happen too many times before I break something. =) I picked up a C4 control consol and am playing with ideas to make this work for this purpose.

Any ideas would be most welcome.

God bless

JB -

There is no reason you can't switch a single power supply among
different transmitters.

Some things to watch out for......

1. Be sure the wire/cable you use is capable of safely withstanding the
700V DC on the HV lead.

2. Be sure the wire/cable is capable of handling the filament current
without significant voltage drop.

3. Ensure that the switch is capable of handling the current and
voltages above.

4. Switch units _ONLY_ with the Power Supply turned OFF.

If it were at all practical, I'm sure it would have been done. One point to note, you would probably need to readjust the bias setting each time you want to use a different rig. No two are exactly the same, that's why a pot is provided.

Much easier just to stack AC4s in the corner.

Good point Jim...

Says the AC-4 would have to be accessible each time you switched, at least. Of course if you're going to all the trouble to set up all the switching, it wouldn't be all that much more to crank the AC-4 up all the way and have an individual pot for each transmitter inside the switchbox..

Thanks Jim, Garey
That is right about where I would have taken it in the shorts. Still might do this but will be much better prepared now. I learn so much by never leaving well enough alone and always having to improve or taylor to my use. Without being able to glean from others more knowlegable it can be a somewhat expensive way to learn. =) Even if I don't rig this up I learned something new about my equipment.

Thanks again.
God bless

Jim makes a great point on the bias adjustment..pretty easy to relocate the adjustment of bias into the switchbox tho..

Also..I gathered from your first response that you want to leave all the other interconnects attached. I dont think there is anything destructive about doing mthis but pretty sure at least the injection lines will not stand being paralleled. My recent experiences with the addition of a y harness to the injection line of a r4a/t4x inorder to run a digital frequency display leads me to beleive that that injection system is REAL touchy and reducing the levels in any way creates issues w/ transceive operation.

Thanks Curt,

Uh...injection lines? Don't understand. Which lines would that be? The only ones I can see to interfer with are the speaker conductors. If you are talking about the cable between the twins, I don't see a conflict since the receiver seems so isolated from the AC4.

From: captcurt2000
Topic: 2044 Message: 2075

Yes I was refereing to the inj for the twins..not specifically related to switching the AC4, but trying to just leave more than one radio connected and switch the right one on. The injection lines probably would not work if one more box was connected to the chain..on or off--seems to be the capacitance of the cable that is the issue.

Cheers,

Curt

> > > > I am not leaving power supply on for more than a few seconds as S-meter pegs out, did

notice that meter stays pegged for a few seconds after power supply is turned off and slowly drops as if capacitors are discharging. Also no lights for meters, tuner light or upper/lower sideband indicator. Clipped C-135 and checked, rated at 10mfd, read 12mfd. I'm an HVAC tech. Monday through Friday trying to be a radio tech. on weekends so any and all help is appreciated. I love a challenge. Thanks, Bob KC9MTW
> > >
> > >
> > Bob -
> >
> > OK. Strange as it may seem, the only measurement you made that may be significant is the first one. Assuming you made these tests as specified, (receiver off, power supply disconnected,) V11 Pin 7 _should_ have a 100 ohm resistor going to the "RCVR CATH" line, which _should_ be grounded via a n.c. relay contact on the T/R relay. This discrepancy WOULD make your S-Meter peg. So your next task is to find R50, connected to Pin 7 of V11. It should be a 100 ohm, 1/2W resistor, and the "other end" should be at chassis ground. Pin 7 of V12 is also connected to this bus, and since it's resistance is OK, the problem is most likely with R50 or its connections.
> >
> > As for the lights, there is a slide switch on the back panel of the chassis that either shorts a 68 ohm, 1W resistor or puts it in series with the panel lamps to dim them. Usually NO lights is an indication of the slide switch contacts being corroded. Try "exercising" this switch several times to see if that lights the lamps.

The radio is working now. I plugged the power supply into a variable isolating transformer and monitored the amp draw, stayed fairly consistent at 3/4 of an amp. The S-meter stayed pegged for abot 1 1/2 minutes and gradually started dropping and noise from the speaker increased as Smeter dropped. I adjusted C-130 until sound in both lsb and usb were app. the same pitch/tone. While going through I found many capacitors which physically appeared in terrible shape, I am thinking of recapping the entire radio as something to do to keep me out of trouble, or get into more trouble, depending on how you look at it. Most of these caps have very short lead lengths and some are in very difficult locations to access. Would having more lead length exposed with new caps be detrimental to the radios performance? It seems having more lead length would make recapping much easier. The schematic shows the values in micro/pico farads but no mention as to voltage rating, any help in determining the correct caps would be greatly appreciated. Thanks, Bob KC9MTW

Bob -

So you have the lights working? As for long "warmup", check R106, probably gone up in value. Replacing caps, especially those in tight quarters and/or with short lead lengths, is quite likely to get you into more trouble rather than out of it!. There is a reason the leads are short! Ceramic caps are very reliable, although failure is not impossible. Many are NP0 or temperature compensating types, again more trouble than improvement by shotgun replacement. Drake use very high quality film (epoxy) caps that rarely fail unless damaged with a hot soldering iron or other mechanical abuse. The electrolytics are certainly well beyond their expected lifetime, but many are still working just fine. Absent an ESR meter, it wouldn't hurt to replace those. Tom, at "Hayseedhamfest.com" has the can-type cap for the TR-3 and the tubular bypass on the AF Output stage is easy. Best approach for the AC-3/4 is the AC-4R from The Heathkit Shop.

> >>>
> >>> OK. Strange as it may seem, the only measurement you made that may be significant is the first one. Assuming you made these tests as specified, (receiver off, power supply disconnected,) V11 Pin 7 _should_ have a 100 ohm resistor going to the "RCVR CATH" line, which _should_ be grounded via a n.c. relay contact on the T/R relay. This discrepancy WOULD make your S-Meter peg. So your next task is to find R50, connected to Pin 7 of V11. It should be a 100 ohm, 1/2W resistor, and the "other end" should be at chassis ground. Pin 7 of V12 is also connected to this bus, and since it's resistance is OK, the problem is most likely with R50 or its connections.
> >>>
> >>> As for the lights, there is a slide switch on the back panel of the chassis that either shorts a 68 ohm, 1W resistor or puts it in series with the panel lamps to dim them. Usually NO lights is an indication of the slide switch contacts being corroded. Try "exercising" this switch several times to see if that lights the lamps.

> > The radio is working now. I plugged the power supply into a variable isolating transformer and monitored the amp draw, stayed fairly consistent at 3/4 of an amp. The S-meter stayed pegged for abot 1 1/2 minutes and gradually started dropping and noise from the speaker increased as Smeter dropped. I adjusted C-130 until sound in both lsb and usb were app. the same pitch/tone. While going through I found many capacitors which physically

appeared in terrible shape, I am thinking of recapping the entire radio as something to do to keep me out of trouble, or get into more trouble, depending on how you look at it. Most of these caps have very short lead lengths and some are in very difficult locations to access. Would having more lead length exposed with new caps be detrimental to the radios performance? It seems having more lead length would make recapping much easier. The schematic shows the values in micro/pico farads but no mention as to voltage rating, any help in determining the correct caps would be greatly appreciated. Thanks, Bob KC9MTW

I have an Eico 950A, would using that and checking for leakage give me, for all practical purposes, the same info as an ESR meter? Is an ESR meter used solely on electrolytic caps or on any cap. over a certain value? Thanks again, Bob KC9MTW

Bob -

The 950A only measures capacitance and _DC_ leakage current, which is the usual failure mechanism for a paper or film insulated capacitor. An ESR meter measures _AC_ resistance through an electrolytic capacitor, which is the effective resistance seen in series with an electrolytic capacitor which is a function of the condition of the "etch" formed on the aluminum foil and the electrolyte solution responsible for the high capacity vs size typical of an electrolytic. It tests by applying an AC pulse at 100 khz or so and measuring the apparent _AC_ "resistance" of the tested cap.

There are several commercial versions and a few good homebrew versions available. A good source of information and specifications of commercial units is at

<http://www.anatekcorp.com/testequipment/esrcompar.htm>

A couple of homebrew versions are at

<http://ludens.cl/Electron/esr/esr.html>

<http://members.shaw.ca/swstuff/esrmeter.html>

Or if you already have a scope and 100 kHz pulse generator, just put a low value (10 ohm) resistor in series with the pulse, apply to the cap and measure the drop across the resistor. Keep the signal across the cap to less than a couple hundred millivolts, and you can do the test without disconnecting anything.

An invaluable piece of equipment if you do much troubleshooting of equipment with electrolytic capacitors in it. (Just about everything electronic!)

2080. TR-7 CW Drift

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-04-09 00:39:40 UTC
From: Al Scanandoah
Topic: 2080 Message: 2080

Hi

When I key down in CW, my TX frequency begins to slowly drift upward. I've got a spare 2nd IF/Audio board - swapping that in didn't make any difference. The 10v supply seems stable.

This happens even when I'm running at about 10 watts, so I don't think it's a thermal issue.

Here's the kicker - AM an SSB appear to be fine.

Any ideas?

73 - Al, K2ZN

Hi!
My name is Forrest licensed WB5HQO 36 years ago. I got my Amateur Extra last Sept. My QTH is San Antonio, TX. I just moved back here from Chesapeake, VA. While there I enjoyed the wonderful company of the Chesapeake Amateur Radio Service. Before leaving I was given a Drake TR-4. The receiver works fine. There is no SSB modulation getting to the finals. Trouble shooting was done up through the filters which were ok. CW works but tune up is quirky. Xmitter gain jumps from 0 to high gain very quickly, and the load cap goes all the way over to the right to get full power. X-AM the receiver goes completely silent. I just started work again so I will be a while before I can buy any parts. Tomorrow I am going to the Medina County club. I hope to find someone there who has a good troubleshooting bench. I sure would like to see this old beauty up and running again.

From: Ken Simpson, W8EK
Topic: 1764 Message: 2082

Drake items for sale:

Drake hand microphone
This is like the hand mic that came with the Drake TR-72, TR-22 C, TR-33 C, and others. It has the standard 4 pin plug wired for Drake/Kenwood, and is a 500 ohm mic. Of course it could be used on an HF rig as well as a 2 m rig. It looks great and works fine. $30

Drake 1525 EM Touch Tone DTMF Microphone
This is the mic that was used to add a touch tone pad to many rigs in the 70s and 80s. It is a normal hand mic from the front, but has a touchtone pad on the back. Four pin mic plug. This particular unit has been used, but is in good shape and includes paper work. $38

Case for Drake TR-33 C
This is the black case that fits the Drake TR-33 C, and has cutouts in the back for antenna, power, etc. It includes the shoulder strap, and is in good shape. $12

Prices do not include shipping from Florida.

Thanks.

73,

Ken, W8EK

Hi all I am a new commer to this group. and I already have a question. I was given a TR-4 that I would like to try out, it did not come with a power cable. Or a power supply that matches. I did receive a DC-DC converter from LS Linear Systems, Inc. They don't look like they work together. opened up looks like a high voltage dc supply. Any thoughts or Ideas.

For starters, I would look in that on-line auction house e-something and find an AC-3 or AC-4. The voltages in the TR4 are particular. Be sure to read up on the bias setting and make sure its correct. If the radio has not been used for awhile, use a variac to bring it up slow.
There have been lots of posts about that procedure here, just look that up in the archives. Good luck. The TR4 is my favorite.

If this is the same small TRS plug used on the T-4B and
Collins stuff they are available on the web, still made by
Switchcraft.
See: http://www.boatanchor.com/reference/connector.html
for sources.

My T-4B has a standard TRS "stereo" jack on it. It may
have been put on by some owner but sure looks like a factory
job.

You didn't say how long the TR7 had been on when you ran into this. I'd put my money on PTO drift. If you have a frequency counter, try looking at the PTO frequency while you observe the drift. Perhaps you made the SSB observation after the rig had warmed up?

Thanks, Floyd

The radio had been on for at least 24 hours, so I doubt that it's a PTO issue.

I believe I have it narrowed down to the 13.695 MHz oscillator on the PBT board. It's probably either the rock and/or the varactor. I'll have to probe the varactor to see if there is any DC drift when keyed in CW.

From: jch39_99
Topic: 2093 Message: 2093

FS: Complete Drake TR4CWrit Station
I made a mistake. Last year I got a Drake TR7 and really liked that rig. So this year I thought I would try Drake's best tube transceiver, the TR4CWrit. Got great signal reports on 40 mtr SSB and CW, but it just is not my cup of tea, prefer the TR7. It is too nice of a rig to just sit and gather dust, so I am selling the TR4CWrit (sn#45368) a 9 out of 10 with manual. Also included is the MS4 speaker, the AC4 power supply, a Shure CB41 desk mike, K4OH's Service information for the TR4C series CD, and a nearly full set of replacement tubes (most NOS, the rest good used ones). Hook up an antenna and you are on the air with a great classic tube station. Not DOA but sold as is. $999 plus $100 shipping to lower 48 states. Postal money order or PayPal + 3%. Save the shipping by picking up within 50 miles of Hendersonville, NC. Pictures available. Tnx for looking. jcharley at bellsouth dot net.

From: wx4us
Topic: 206 Message: 2099

I apologize, I am one of the newer members in the group and I have not introduced myself. The name is Fred and the call is WX4US. I hold an Advanced license and have no intention of upgrading to Extra. The dividing line between Advanced and Extra was always 20 wpm code and even with the help of Olla Slone, WD8MOU silent key, I could not quite get there. Even with the new rules governing the Extra class I respect the 20 wpm dividing line. I was first licensed in 1986. I have lived the last 10 years in Pensacola and prior to that in Northeast Ohio under the call signs of N8IAO and KB8APH.

My Drake equipment is as follows: a B line, a C line, a TR-6, W-4, MN-2000 and 2 MS-4s with AC-4s. I'm currently reorganizing the shack. I have an old picture of it that I can share, but it does not showcase the Drake equipment.

I enjoy hanging around 14.200 and listening for DX or 7.251 for the hams on South CARS. For every hour I spend in transmit, I probably spent 200 hours listening. I'm hoping this May will bring some good 6 meter conditions. I'm relatively new to 6m and I'm looking forward to operating the "magic band".

I retired 3 years ago and that's when the equipment came out of the closet. I packed it up when I moved to Florida and worked so many hours that I never had a chance to unpack it. I've discovered that some things died a slow death not being used and other things survived the isolation and look and operate like new.

Hi
Mine just developed a fault. Haven't looked yet but thought I would ask first.
In Tune position loads up perfectly to 100w. Go to CW position and with gain increased to max only get 60w. Then I go key down and tune it in the CW position. Again I get 100w but I have to alter the load setting to get it and re adjust the dip. A minute later it's back down to 60w and again I have to re-adjust the plate and load settings to get back to 100w etc. etc. etc.
Also the XYL tells me she is getting TVI.
My guess would be the coupling cap to the tank cct but probably someone has had a similar experience and can assist me.
Cheers
Vic

WINK
WA8KOQ ..

> Hi
> Mine just developed a fault. Haven't looked yet but thought I would ask first.
> In Tune position loads up perfectly to 100w. Go to CW position and with gain increased to max only get 60w. Then I go key down and tune it in the CW position. Again I get 100w but I have to alter the load setting to get it and re adjust the dip. A minute later it's back down to 60w and again I have to re-adjust the plate and load settings to get back to 100w etc. etc. etc.
> Also the XYL tells me she is getting TVI.

Hi Mike!
There has to be an offset between TX and RX. For example my HW-8 has a DC receiver and the TX is 700 hz different from the RX freq. This is how you get your audio tone. Although I must say the 500 hz sounds a little low.
Hope this helps 73s.

The Drake spec for the TR7 CW offset is 800 Hz. This is adjustable via
a trimmer cap on the 2nf IF/Audio board. I think where the confusion
sometimes arises is that Drake shifts the TRANSMITTER down 800 Hz from
the dial frequency, whereas import rigs tend to shift the RECEIVER up
from the dial frequency. IOW, the Drake will read the RX frequency on
the dial, while an import rig would read the TX frequency on the dial.
Not a big deal, but enough that it could cause one to miss a sked if
listening with a narrow filter...

I am WA5OTR and and have been following this forum for about a year. I rarily post! I have been an Advanced Class since apx 1970 operating all bands SSB 1.8-450 MHz SSB, FM and a smidgeon of CW. On July 7, 2007, my tower took a sustained lightening hit which did $13000 of damage that was only partially paid (apx 40%) by insurance. When trying to decide how to rebuild my station on extremly limited funds, I starting having nostalgia thoughts and the yearning for the warmth and glow of tubes and the feel of an old analog dial. My dream of an Drake station from my early days when I was raising my family on limited income took hold again and I eventually purchased an R4C and T4XC over Ebay. Both radio, unfortunately had more issues than was advertized (nothing unusual) and I ended up seeking the help of an established Drake expert who did a marvelous job on both. I hang out around 14.2MHz.

Andrew -

If the T/R relay 'clicks' when you switch to TUNE mode, check the CENTER terminal of the relay. The "arm" is ground, and controls the Receive and Transmit condition. Relay open, the N.C. contact (top) should be grounded, activating the Receiver circuits. Relay closed, the N.O. contact (bottom) should be grounded, activating the Transmitter circuits.

If the relay does NOT click in TUNE, then you'll have to investigate V19b circuitry.

Hi Garey and Wink

4XC up and running again - don't know how or why!!

Checked R's 104 & 106 and both OK.

So rocked all the valves and the relay and gave all the switches a small dose of contact cleaner (particularly S1d) then rotated them back and forth. Stuck it back on line and hey presto 100%.

I have to admit that I am a smoker so maybe the switches wanted de-tarring!!

Thanks for help.

Vic -

Can't argue with success!

For an otherwise working transmitter, those two resistors, the GAIN control itself, and the associated switch and wiring is all there is to it!

It IS a low voltage / low current circuit, so switch dirt is a consideration. Easier to check the resistors first, since R104 in particular tends to go high with age.

2121. Drake 2-B comparative performance

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-04-29 09:48:53 UTC
From: gerrykav
Topic: 2121 Message: 2121

I have recently acquired a Drake 2-B/2-BQ setup. It is in physically excellent condition, and seems to be working pretty well too.

When I compare reception with some other radios I have, however, it seems that the 2-B is not performing up to what I expected. I have compared it to a Kenwood TS530SP, a Yaesu FT897D, an Alinco DX70TH and an Icom IC756 ProIII, and in all cases, the 2-B seems a good bit noisier. Also, if, for example, 20m is full of stations on the ProIII, I might hear 1 or 2 of the stronger ones on the 2-B.

Maybe I'm being unreasonable expecting a 40 year old radio to keep up with some of the best that the 21st century has to offer, but I understood that this was not entirely unrealistic.

I am considering a full overhaul... valve tests, pot/switch clean and maybe even cap replacement. Do the esteemed members of the list think that this would be worthwhile, considering that it does seem to work pretty well, sensitivity aside. No scratchiness on the pots or anything.

2122. Re: [DrakeRadio] Drake 2-B comparative performance

Topic: 2121 Message: 2122

This is definitely NOT normal. The 2-B in good order and alignment
will hear stations those receivers couldn't even imagine.

There are two specific areas to check first. I will attach some docs
from my service CD on the 2-B that will get you started.

The basic situation is that the 2-B has an _extremely_ high impedance
AVC circuit. As a result, it is subject to leakage across insulators,
gassy tubes, and misadjustment by "fixers" using inadequate test
equipment without proper consideration.

Gerry,

Your 2-B may need an alignment and/or a new tube or two. In addition, tubes are inherently more noisy than transistors.

73,

Bob AD3K

Hi Gerry-
There is no reason that the 2B shouldn't be as sensitive as anything else. First thing to do is check all the tubes with a good mutual conductance tester. This will give you an idea of tube quality. If
all tubes check good, do an alignment via the manual. If you need new
electrolytics that will be easily deduced by the hum in the audio!
Especially while using the 2BQ on CW sigs! I have 6 2B's here and 1
2A and they all hear as well and sometimes better than my more expensive receivers. You should be able to obtain a sensitivity of less than .5 microvolts, maybe to .3. Keep us informed.
Joe-WA9LAE P.S. If things still aren't up to snuff, there are many here who can help and lots of good stuff in the files.

Thanks everyone for the replies.

I do not notice any hum on the audio... this applies with listening to CW, any carrier heterodynes, or the crystal calibrator carrier.

I believe that I should be well able to carry out the necessary repairs, and will endeavour to do so with a measure of sensitivity to the radio and its heritage.
I also have a friend with a valve tester, so I'll ask him to do the needful there.

Garey, thanks for your offer of attaching docs... I came across your site while looking for information over the last few days, and will be purchasing one of your CDs in the near future.

Note that valve testers are notoriously poor at testing for gas, (among other things.)

New, preferably known good valves are the only way to ensure that you don't have a valve problem. Other than a seriously depleted cathode or element short, your guess is as good as the tester's! :-)

The 12BA6 and 12BE6 are particularly susceptible to gas problems, and even new old stock valves MAY be gassy.

Also note that the correct valve is an 8BN8, NOT the "logical" 6BN8. This is for hum reduction purposes.

As mentioned earlier, the high impedance circuitry in the 2-B makes it susceptible to moisture absorption when stored or just left off for long periods in humid conditions. Letting it run for several hours after storage will often clear up strange problems. A warm, dry 2-B is a happy 2-B...! :-)

All that said, the 2-B is a great receiver, and will be your favorite when it is working properly!

Ditto on the NOS tested good 12BA6, has left me scratching my head a few times. Nice to have a working reciever that has good tubes.

Wether tubes are inherently noisier or not the noise
level should be well below the noise delivered to the set by
the antenna, the input stage of receivers with RF stages is
rarely limited by the noise figure of the input stage. Even
my ancient S-20R is limited mostly by atmospheric noise or
local electrical noise. Its much more likely that this RX is
out of alignment or has some other problem.

Richard,

Atmospheric noise dominates until you get up around 15 meters. On the higher
bands the noise level of the receiver becomes more important, since the
level of atmospheric noise becomes less.

So what is the correct strategy to obtain tubes of sufficient quality to work well in the Drake AVC circuit? I have an R-4 with suspect AVC performance, probably one or more of the tubes in the AVC are not up to par. Just buying "NOS" tubes seems an expensive and probably unsuccessful way to solve the problem. The only tube tester I own is a simple emission tester, so a gassed tube can't be identified.

Granted that "tubes are noisier than semiconductors", (a VERY broad statement,) primarily because of thermal agitation of electrons, the basic fact remains that for just about anywhere you care to be in today's world you have to go well above 30 MHz for a receiver to be limited by "internal" noise.

Gerry,

The 2B is one of the best receivers I've ever used with respect to sensitivity, and it's only mildly noisier than my TR-7.

There is a capacitor kit available with a replacement for the power supply filters and includes an electrolytic on the cathode of the audio output stage.

http://www.hayseedhamfest.com/capkit.htm

It made a lot of difference. Never bothered to do an alignment but did replace 3 tubes recently. As a result the 2B is significantly quieter and a little more sensitive.

Hang onto it - they're among the best

Curt -

Good question. Fortunately, a large majority of NOS tubes ARE ok. My warning is actually to make you aware that replacing a single tube with a new one, when you suspect gas might be the problem, MAY not ABSOLUTELY PROVE that the problem is something other than a tube.

Certain tubes seem to be more susceptible to gas problems, 12BA6, 12BE6 and a few others. Of course part of the problem is that these are the tubes that are used in high gain IF and Mixer stages that are designed to have their gain controlled by a negative bias on the grid!

So.... If you have a condition that you think might be related to a gassy tube, and replacing the tube with a NOS one does NOT cure the problem, it would be best to try another tube before eliminating that possibility completely.

"Professional" repair people have long kept a private stash of "golden", or KNOWN good tubes for troubleshooting purposes. As has been said so many times, the only absolute test for a tube is "does it work properly in the circuit under investigation?".

A couple of spares for tubes in your radios is a good idea. They're not going to get any cheaper! If you have a friend with the same or similar unit that is working well, stick one of your spare tubes in his radio and see if it keeps working!

One other tip. Gas problems tend to show up after 15-30 minutes of operation. So if you zero your S-Meter at turn-on, and 15 minutes later its drifted below (or above) zero, you likely have a gassy tube.

My own take is that gas is seldom a real problem. Tubes
are subject to a lot of defects, for instance heater to
cathode leakage which can cause a bias shift and variation
of emmision with time. Drift in DC circuits can be caused by
either.
Many tube testers are set up to detect inter-electrode
shorts but that test will often show up a gassy tube.
Simple emission testers are useful mainly for finding
tubes which are nearly dead, a transconductance or mutual
conductance (they are different names for the same thing)
tester is much more useful because it tests tubes as
amplifiers. Its quite true that a tube which tests good may
not work in some circuits. That is because some designers
relyed on tubes to be out of spec and have higher or lower
transconductance than "normal". An example is the Boonton
type 202A signal generator. These have three tubes of the
same type (I've fogotten which) but at Hewlett-Packard they
came under three part numbers each selected for the correct
transconductance for the particular position in the
generator. This is really bad design but similiar situations
are fairly common.
As far as the 2B under discussion I rather doubt if a
tube is the problem.

I think that in the light of all the advice that has been given, I'll start small and work my way through, checking as I go for improvements. I know the ear is hardly a measure of performance, but, in the absence of test gear, it will have to do. I'll start be reseating everything and giving the chassis a wipe down and continue by recapping and doing the alignment as per the manual.
Given the cost of tube sets, I will probably pick up a set anyhow... I have a couple of sets of drivers and finals for the TS530, which I will probably never use, but it gives me a feeling of comfort to know that they're there (for the great tube drought of the future :)).

I did some more subjective testing, and it seems that the AVC circuit might be behind some of the perceived issues. I experience S3 noise on 80m in the morning where I live, and the Pro III can hear stations not far above that quite well. If I tune the 2B to the same frequency, I can tell that there's a station there, but it never seems to quite resolve out of the noise with either fast or slow AVC. It also seems that the product detector may be experiencing some issues, as the zero-beat point, or the point where the quackiness is at a minimum never quite happens, unless it's a seriously strong signal.

I think if you had seen as many tubes exhibiting "gas" or "grid emission" and dragging down AVC lines as I have over the last 50 years you might change your opinion!! :-) I believe it's highly likely that the 2-B under discussion is an AVC problem, and most of those turn out to be a tube problem. It may in fact be as simple as a misadjusted AVC threshold adjustment, often caused by using a low impedance DMM rather than either a quality DMM or VTVM.

The 2-B AVC circuit especially can be dragged down by an 11Meg VTVM, and 12BA6 tubes especially just love to even go slightly positive on the grid in an otherwise well operating receiver.

Drake engineers were pretty good about designing circuitry so that tubes could be replaced without realignment. NO new tube sold 40 years ago should have been gassy, so it was not unreasonable to expect any new tube would perform as expected. With the tubes available today being at least 30 years old, and stored in unknown and certainly uncontrolled conditions, all those expectations are long gone! The "gas" test performed by most quality tube testers does NOT discriminate between true gas and interelement leakage, so a tube that is not "gassy" could still test gassy due to leakage.

Your 202A example is a situation that often happens when the capabilities of the hardware are pushing the envelope of the day. Tektronix used lots of "selected" and "aged" tubes in many of their scopes, because the tube manufacturer's specifications were fine for use in a TV set, but only a much narrower set of conditions would suffice for what Tek was doing with their scope designs. My professional life was entirely solid state, and I'm all too familiar with what we had to do to get transistor power amplifier transistors to operate at 450 MHz forty years ago!!

It'll be interesting to hear what the problem, (and there IS a problem,) turns out to be!! :-)

Have you learned to use the Passband Tuning yet?

Check the AVC setting procedure on page 26 of the manual. This sets the overall gain of the receiver.

Set the S-Meter to S-1 using the adjustment just above the Phones jack on the front panel. If you have the 2-AC Crystal Calibrator, you can approximate the S-Meter calibration by tuning in the Calibrator at 3.8 MHz, and adjusting the S-Meter Cal control for 20 dB over S-9.

> I think that in the light of all the advice that has been given, I'll start small and work my way through, checking as I go for improvements. I know the ear is hardly a measure of performance, but, in the absence of test gear, it will have to do. I'll start be reseating everything and giving the chassis a wipe down and continue by recapping and doing the alignment as per the manual.
> Given the cost of tube sets, I will probably pick up a set anyhow... I have a couple of sets of drivers and finals for the TS530, which I will probably never use, but it gives me a feeling of comfort to know that they're there (for the great tube drought of the future :)).
>
> I did some more subjective testing, and it seems that the AVC circuit might be behind some of the perceived issues. I experience S3 noise on 80m in the morning where I live, and the Pro III can hear stations not far above that quite well. If I tune the 2B to the same frequency, I can tell that there's a station there, but it never seems to quite resolve out of the noise with either fast or slow AVC. It also seems that the product detector may be experiencing some issues, as the zero-beat point, or the point where the quackiness is at a minimum never quite happens, unless it's a seriously strong signal.

let me recommend RF Parts,

http://www.rfparts.com/

an excellent source of "rf parts" and not just vacuum tubes, run by Hams. They also have an outstanding collection of some famous boat anchors, if you're in So Cal they're just north of San Diego. All the tubes whlich I have purchased have all turned out to be a good investment although they aren't cheap.

Incidentally, I'm becoming acutely aware that bipolar transistors are becoming more rare than old tubes! Some transistors in a MC 2105 audio amp I have are no longer available - anyone have a good source?
already checked Mouser, Digikey, etc.

Grant

Give this place a try and see if they have what you are looking for as they specialise in obsolete transistors etc.

I find that many original part numbered transistors and DIP□s can be cross referenced at NTE Electronic, http://www.nteinc.com/ , to a suitable substitute.

Hi
My TR7 is fitted with a 115v AC fan but as I don't have the PS7 and run it from a standard 25/30 amp PSU I don't have 115 AC.
I have a 12v DC fan which fits. A while ago I read something about using a thermistor so that the fan came on as required. Can anyone tell me what spec of thermistor I need to run from 12v and the best place to place it. Also the most convenient place to tap 12v off to run via the thermistor to the fan?

Vic -

Couple of things.

1. I don't think the "variable" fan is a good idea. Much better for a consistent internal temperature that the fan run continuously. If the fan is noisy enough that it's a problem, then slow it down or get a quieter fan. It doesn't take a "hurricane" of air to keep the transceiver at a reasonable temperature. Whatever you do, mount it to blow _OUT_ as the TR-7 cooling system is designed.

2. The best place to get your "12 VDC" is to just add a couple of leads in the back of your DC connector and bring them over to the fan. No internal hacking required.

Hello Garey

Dependable as ever.

Yep I take your point about the variable fan/constant temp etc.

So it becomes a very simple job - just hook up the fan to the PSU / DC connector(blowing out) and off we go. As you say this will keep it at a constant temp as opposed to highs and lows.

Thanks and cheers

Vic

I agree completely with Gary.

If you have a source of 115 VAC available, it's easy enough to power the stock fan. You can either wire up an AC power cord to the correct pins on a Jones connector that fits the PS7 control connector on the back of the rig to allow the fan to be switched on with the power switch on the radio, or just plug the fan itself directly into an extension cord to a 115 VAC source that you can switch on/off.

If you go with a 12V fan, try to get a good ball-bearing fan, or a Panasonic Panaflo. The typical cheapo sleeve bearing "computer" fans are designed to die when you need them the most. At least, that's the way it seems...

2146. R-4 cable question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-05-05 22:27:17 UTC
From: russellhulett
Topic: 2146 Message: 2146

Recently bought some cables (from a Drake cable fabricator) to interconnect my R-4 with my T-4XB. The RCA connectors on the R-4 are too close together to allow the cables to seat properly because of molded covering of the RCA connectors. Obviously the purchased cables aren't correct for the R-4, despite the fact I specified they were for the R-4.

Appreciate advice about where to obtain the correct cables, alternatively where to obtain the correct RCA plugs to rebuild the cables.

73, Curt KB5JO

Hi Curt-
Why not try trimming off the molded part so the metal shell is exposed?
If this doesn't work out you can always clip off the connectors and solder different ones that do fit. I'm sure you could get those from Mouser; maybe even Radioshack.

Have a Drake R4, serial number 0035 and a T4, serial number 0537 that were obtained from a former SK. Both items are in exceptionally good condition and with the exception of a little dust, the copper chassis on both items are very clean. Both the receiver and exciter are in operating condition as I tested both with a good AC3 power supply. I am inclined to believe that these were purchased originally by the SK although I don't know that for a fact. If someone in this group is interested, I'll entertain a good offer for both units to include shipping. My email is good on QRZ.com.
Thanks

2155. Re: [DrakeRadio] TR7 and R4C

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-05-07 08:52:28 UTC
From: g4jss@tiscali.co.uk
Topic: 2155 Message: 2155

Hi Jim and all

Thanks for info. Have temporarily fitted a cheap 12v computer fan - bit noisy but will do until I get something better.

A further question re R4C. I have two of them and they both work well. One is a much earlier model than the other. On one of them when I switch on the S meter needle slowly rises to nearly FSD and then settles back to where it should be. All the other tube receivers I have owned did exactly the same - as soon as the tubes warmed up the S meter needle returned to normal.

But with the second R4 the S meter needle goes increasingly negative and then starts to rise and then settle when the tubes become operational. To me this is not normal.

So why the difference?

Vic

Vic -

Depending upon just "which" two s/n units you are comparing, there are some differences. ALL R-4C S-Meters are a bridge circuit that compares the current drawn by the 1st and 3rd Mixers with the current drawn by the 50 kHz IF. So the warm-up characteristics of those tubes (among other things) determine how the meter responds at turn-on. The 50 kHz IF (V5) has always been a 6BA6, and this tube is NOT a controlled warm-up (11 seconds) type. The 1st Mixer (V2) was first a 6HS6 (controlled warm-up), and then a 6EJ7 (not controlled) in various s/n receivers. The 3rd Mixer (V4) was first a 6BA6 (NC), then a 6HS6 (C), and finally a 6EJ7 (NC). So you can see there's no "controlled" set of all three tubes, and since the current drawn is directly related to warm-up there's really no way to predict what the meter is going to do at turn-on!

Your second receiver is merely telling you that V5 is reaching operating temperature earlier than V2 and V4.

To tell you the truth, I never noticed differences! My only concern is that the S-Meter consistently settles at S-1 at turn-on, and is still at S-1 hours later.

2158. For Sale: TR-6, RV-6, AC-4 and MS-4

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-05-12 05:48:42 UTC
From: Ron Patterson
Topic: 2158 Message: 2158

I am selling these items to raise funds for the Cal Poly Amateur Club. I thought I would offer them to the list before taking them to Ebay.

The TR-6 is sn 421 and comes with the rare 9-NB noise blanker. The radio is operational and has been bench tested. It is putting out 125 watts and the receive sensitivity is 0.2uv. The radio is in good overall condition. The case has been repainted with black semi-gloss. If it were mine, I would send it out to be powder coated. The price is $850 plus shipping.

The very rare RV-6 vfo is sn 036. It is in good operating condition. The case has the original finish and has some nicks and scratches. The chassis is very clean except for some areas of corrosion. The price is $800 plus shipping.

I also have an AC-4 for $80 and a MS-4 for $50 plus shipping.

Pictures are available for serious buyers upon request. If there are no takers, I will be putting them on Ebay this coming weekend.

73,

Ron W6FM

2159. Valves?

Yahoo group: DrakeRadio (2006 — 2011)

From: Victor Waddington
Topic: 2159 Message: 2159

Hi all
Been having a clear out (happens once every decade)and found a pair of items that I have no idea about - or where they came from!
I am assuming they are valves of some type.
For starters they are marked STC and type No. is 4X150A.
They have a very dumpy glass envelope with a metal surround and cooling fins also there is a centre keyed locating post and eight pins.
I have no literature on valves so back to you group, please.

Vic

I believe these are a precursor to the 4CX250 tetrode RF power amplifier tube. Same basic design, except rated at 150 Watts plate dissipation instead of 250 Watts due to the use of the glass insulator instead of ceramic. It's an external anode design, the cooling fins are the plate connection.

The 4X150A was, I believe, the first external anode air cooled small tetrode transmitting tube. The design originated at Eimac but similar tubes were built by several manuacturers. The tube had several variations, up to, I think, the 4X150D, There were others in the series up to several kilowatts dissipation. These tubes were all good to around 150mhz at full power. The ceramic base series followed and had a number of improvements. They were quite widely used in amateur and commercial equipment up to a few hundred watts and as drivers for high power stuff.
The series included the 4X250A/B, etc., and its more likely the 4CX250 was the replacement for this.
STC is Standard Telephones and Cables, a british company. I don't know if STC actually built tubes or only contracted for them. STC was the British distributor for Western Electric stuff for years.
I was pretty sure one of the Eimac or RCA transmitting tube handbooks was on the web but I couldn't find it my collection of downloaded stuff or by searching several sites

that have books. Its still worth a search.
BTW, I can't seem to find the orignal message in this
thread.

2170. How to Tighten R-4 Tuning Scale Adjuster

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-05-15 12:36:34 UTC
From: russellhulett
Topic: 2170 Message: 2170

I'm new to Drake rigs and this group, having recently bought an R-4 and T-4XB. The tuning scale adjustment on the R-4 is too loose to hold setting. I've searched through all the mailing lists, web forums, and the manual without success for how to tighten this up. What is the procedure to tighten the adjuster?

Curt -

Loosen the setscrew on the MAIN TUNING knob and remove it, along with the metal skirt behind it. There should be a short length of rubber or plastic tubing around the tuning shaft. Depending upon the condition of this tubing, (unless it is missing!,) it may either need to be replaced or just have the ends scuffed up with sandpaper. The original is 3/8" id by 5/8" od, by 1/2" long. Various types of tubing will work, from soft amber colored surgical tubing, to clear polyethelene, to automotive heater hose, to ...

IF the tubing is there and is in reasonable condition, often all that is needed is to replace the skirt and knob, and press in on the knob (to "compress" the skirt against the outer end of the tubing,) and tighten the setscrew.

Take of the knob and you will see a rubber tension washer. (usually light grey). Buy some new rubber tubing and cut it to size and install. The old one is probably dried out.

Just an FYI in case anyone else experiences this peculiar behavior.

The problem was a failed switch section in U1001 on the PBT/Reference board. When in CW TX, there was no voltage being applied to varactor CR1001, so the capacitance was simply drifting about.

Popped in a new 4066 bilateral switch, and life is good.

Now to see if I can implement a QSK scheme...

Al -

I don't recall seeing your original post here, if you did...??

Anyway, yes, the 4016 ICs are somewhat failure prone. U1, the one that handles the RIT switching, causes similar problems. I always install a socket when I replace any of them. They sometimes fail open, and other times just get noisy.

Good catch!

I purchased a basket case TR3 last summer. Very poor shape. I've had a blast restoring it. It receives and transmits fine. But, it has one re-occuring problem that has me stumped. It will at random jump 150Hz in frequency, then stay there for a minute or so, then jump back to the original frequency. It can go for an hour without doing it, or it will do it 20 times in one hour. No patttern to it. It happens on all bands. Since it happens on 20 meters it is either the VFO or the 9MHz BFO (since the hetrodyne oscillator is not used on 20). I put a counter on the 9MHz bfo and it stays very stable. I rebuilt the VFO and it tunes silky smooth. Replaced the 6AU6 VFO tube with known good one. Checked the 150V regulator, replaced it. No voltage jump. Re-did the grounds around the 6AU6 socket. Still jumps frequency. I checked the alignment of the VFO gears and mechanics.

Could it be a cap or resistor? Any ideas?

Thanks for reading this long note.

2187. TR4C out of storage & into XMIT

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-05-22 16:20:48 UTC
From: Patricia Turpin
Topic: 2187 Message: 2187

Hi all,

I just unpacked my old Drake TR4C after storage for about 15 years. When I turn it on, it is in transmit. With the switch in XCW, and all drive knobs at minimum and into a dummy load, I can hear a carrier on my other HF rig. If I set the Drake for 7.250, I get the carrier at 7.250 (or there abouts). If the switch is in either SSB settings, it is still in transmit. I will probably open the case this weekend and 'thump' a tube or two! I have turned the VOX & antiVOX just a bit and have put a straight key into the KEY connector - and pulled it out.

Have any of you experienced this happening on any of the 4 series transmitters or transceivers? Just looking for a place to start.

In case you need to know (when you see my name), I have a scope, volt meter, and frequency counter but no frequency generator (looking for one on ebay). I've been away from Ham Radio a while and always liked the Drake for it's punch and clean audio.

Hi Patricia -

The "X-CW" position of the MODE switch is the TUNE function, and keys the transmitter. SSB is the "Standby" position, and should put you into receive mode.

The first check is to see if you have any "idle" plate current, which should be 100 mA when the transmitter is keyed with no modulation and/or if a code key is plugged in and "open". Turning the XMTR GAIN control full CCW should give the same result.

If you are using the AC-4 Power Supply, the idle BIAS is set with the control on the power supply chassis.

With the SIDEBAND switch in X, switching from SSB to X-CW should result in an audible click from the T/R relay, and result in 100 mA plate current. Advancing the XMTR GAIN and peaking the RF TUNE should increase the plate current which should then be dipped with the PLATE control. Switching back to SSB should then drop the plate current to 0 and activate the receiver.

Excuse my incoherence, but I've been on the road all day. Hopefully I haven't confused you too much.

2190. Need some informations about Drake SPR-4

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-05-24 05:04:12 UTC
From: Hans-Joachim Empel
Topic: 2190 Message: 2190

Hello Folks ,

im the new Owner of an DRAKE SPR - 4 Serial Number 327

its a great receiver but i have some questions about the handling and setup the XTALs of the RX.
hopefully somebody can give me some ideas for the handling´and setup

1 : what kind of position on the Crystal Selector Switch the Preselector and the Range Switch i need to receive the Frequency from 150kHz to 500kHz ????

2: in the Receiver there are all 23 Cristals installed like : first socket 11.59 MHz
second socket 12.09 MHz
third socket 12.59MHz and so on.
is this correct ore is there some role to set the Xtals in some special setup for the Cristals in the sockets ????
There is no good Description inside the SPR - 4 Manual for aswering Question 1 and 2 maybe some OM has experiance in setup the cristals and can give me some Help.

Following Xtals are available in my RX : 11.59 ,12.09 , 12.59 , 13.09 , 14.59 , 16.59 , 17.09 , 18.09 , 19.59 , 20.59 , 22.09 , 22.59 , 24.09 ,25.09 , 26.09 , 28.59 , 29.09 , 32.59 , 36.59 , 38.09 , 39.09 , 39.59 , 40.59 MHz
XTAL Socket No : 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23

Specially Questions No. 1and 2. gives me a lot of gray hair.

I own also a DRAKE R8A and a DRAKE R8E with a VHF Converter , thats are great RX - machines , but the SPR - 4 is also a good RX - machine.
I am verry impressed about the SPR - 4 , its hot like a gun , if you receive signals on shortwave.

Hopfully somebody can help me
all idears are welcome

my email is hajoempel@...

2194. TR-4 noise blanker alignment and misc q's

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-05-27 04:04:30 UTC
From: Chris Farley
Topic: 2194 Message: 2194

Hi all, hope everyone had an enjoyable Memorial Day weekend!

I have a TR-4 S/N 30547 that has the noise blanker, but it must be a fairly early one as it is not the plug-in type- it is wired directly through a hole the chassis near the front. My question is this- The adjustments in every manual I have come across is for the plug-in type. There are several differences, most of which I have figured out. There are a couple that I am having trouble with though-
There is a trimmer on a little board underneath the chassis that straddles the Band switch, and I can not seem to do the "B" adjustment in the manual, which wants the blanker off, measuring voltage between terminal 8 (terminal 4 on the schematic I have) and ground, while peaking R-24 for positive voltage. Problem is, with the blanker turned off, there is no voltage present. With the blanker on, R24 seems to have no effect on voltage whatsoever.

Another problem I'm having is the neutralization.. It keeps changing! Is there a known flakiness somewhere in these that I'm not finding, or is there a sagging grid or something in one of my PA tubes? It's not consistant or drifting with warm-up or anything- it's just different each time I turn it on and tune up- dipped plate is never max pwr out.

Final issue regards Injection coupler alignment. On the 10m adjustments, I am unable to see a peak on one of the adjustments. I *think* I had this same problem with my other TR-4 too. Is there a better way to perform this alignment? I have a scope and sig gen, but no "good" frequency counter. My absolute last resort would be sending it off to be aligned- I wouldn't learn anything that way!

Any ideas? Lots of questions here, I probably should have split it up and asked one at a time after figuring it out! The blanker does seem to work pretty well as-is and the radio performs reasonably, but I'm trying to go through this thing once and for all so I can finally put the covers back on and put one in the car!

Thanks!!
Chris KC9IEQ

Actually, you might get a better response if you posted the question to
the Drakelist reflector.

Offhand, I would think it would be .... ground braid modification.

Whatever.

Hello all
Bit of a problem with my Rx. Keep getting weird noises. Difficult to describe. The nearest I can get is if you walk into a large concert room and someone is on a mike and due to feedback it starts to howl/screech. At first I thought it was one of my neighbours on a CB or a passing taxi because every now and again I could hear distorted speech - cross modulation? But I don't get it on my other Rx's.
Any ideas, please?
Vic

Chris -

The small board is the "NBK" board, and is used to match the NB to the older "soup can" filter. A TR-4 with your s/n should have the two blue filters with the external SIDEBAND switch, and should NOT have the NBK board installed. There should be 470 ohm resistors across T6 and T13, NOT 2.2k ohm resistors.

The R24 adjustment is done with the Blanker ON, but the Calibrator turned OFF. The adjustment is VERY sharp, and is easy to pass if you adjust too rapidly.

Changing neutralization is typically associated with 'off-brand' final tubes. Anything other than Sylvania, Zenith, RCA or GE brands are subject to all manner of "possible" problems. There are other possibilities, but until you have a pair of the "known good" tubes, of the same manufacturer, you're beating your head against the wall! :-)

The 10M Injection coupler alignment is pretty broad, and doesn't have a sharp "peak".

Topic: 2194 Message: 2198

Hi Garey,

Thanks for all the information! I'll re-attempt the R24 adjustment, (perhaps with a different analog meter with a quicker movement), and I'll just assume 10m is good enough as-is. The calibrator signal was weaker than expected up there, so I just assumed there was a better way to perform that alignment, given the trouble I had. Fair enough!

I will check for the 470 ohm resistors across T6 and T13 instead of the 2.2k's. I can't picture them or what their purpose is w/o a schematic handy, is it somehow related to the filters?

Regarding the "NBK" board- Unless I have given a misleading description, it certainly seems to be there. Yes, the radio does have the blue filters, not the earlier separates or the soupcan. I didn't even think a NB was available when they were still using the soupcan filter!
I'm at work now, but offhand the board is about 1 1/2" square, has a metal screw/ceramic type trimmer cap, a toroid coil/transformer, possibly some misc resistors and whatnot, and the band switch shaft goes through a hole a bit offcenter in the board. There are a few pieces of thin coax (RG-174/U size stuff) going to a tube(s), and the NB board. Given all this, what procedure would I use to adjust this trimmer, or should I leave well enough alone? I can only assume that SOMEthing has drifted or changed over all these years, resulting in some sort of adjustment being needed.

On the PA tubes, I am well aware about branding and all that fun stuff, and they were tested as good the last time I had them out. Can't say for sure if they are the same date code, plate structure, or stamped brand, but they are definitely of Sylvania manufacture. I'm predijust against RCA's in RF PA's, and GE's in general. I could try swapping them out, but I don't have any "good" spares at the moment.

Does this help at all, or only present more questions??

Regards,
Chris

Chris -

OK. Well if you were trying to adjust R24 with a DMM ... :-)

Whoever installed your NB did it wrong. The NBK board is NOT required and should be removed. The resistors mentioned before are to terminate the filters and are most likely the incorrect 2.2k rather than the 470 ohms they should be for the separate filters. The trimmer on the NBK board was just peaked on the calibrator signal.

The NB-34 Blanker was designed for the TR-4 with the 470 ohm filters To allow it to be retrofitted into the TR-3 and early TR-4s which used the 'soupcan' and 'one-box' filters, the NBK board was designed to compensate for the higher impedance of those filters, 2.2k ohms. Later TR-4s used the same blanker without the NBK board because it was not required with 470 ohm filter impedance.

I think I have a "notes" sheet on my TR-4 CD that addresses all this.

I agree on the RCA and GE tubes, but they DO work consistently. The GEs seem to drop off in output faster than the other three, but not significantly. If in fact you DO have two tubes of the same manufacturer, perhaps an element support has broken or some other anomaly. The other potential trouble spot is the small disc ceramic capacitor connected across the neutralization cap. It's 12.5 pF, 2000V, NP0.

> I will check for the 470 ohm resistors across T6 and T13 instead of the 2.2k's. I can't picture them or what their purpose is w/o a schematic handy, is it somehow related to the filters?
>
> Regarding the "NBK" board- Unless I have given a misleading description, it certainly seems to be there. Yes, the radio does have the blue filters, not the earlier separates or

the soupcan. I didn't even think a NB was available when they were still using the soupcan filter!
> I'm at work now, but offhand the board is about 1 1/2" square, has a metal screw/ceramic type trimmer cap, a toroid coil/transformer, possibly some misc resistors and whatnot, and the band switch shaft goes through a hole a bit offcenter in the board. There are a few pieces of thin coax (RG-174/U size stuff) going to a tube(s), and the NB board. Given all this, what procedure would I use to adjust this trimmer, or should I leave well enough alone? I can only assume that SOMEthing has drifted or changed over all these years, resulting in some sort of adjustment being needed.
>
> On the PA tubes, I am well aware about branding and all that fun stuff, and they were tested as good the last time I had them out. Can't say for sure if they are the same date code, plate structure, or stamped brand, but they are definitely of Sylvania manufacture. I'm predijust against RCA's in RF PA's, and GE's in general. I could try swapping them out, but I don't have any "good" spares at the moment.

You're getting the wrong idea, it's no bother to post here. It's jsut
that Drakelist gets a lot more traffic, and most of the gurus seem to
hang out there.

It's actually very easy to find. In Firefox, you can just type the word "drakelist" into your URL box, and it will magically find the home page. Google will also find it. Now that I've typed all that, here is the URL:

http://www.zerobeat.net/drakelist/

Follow the instructions near the bottom to join the Drakelist mailing list. You can also join the Drakelist web-based forum, but the mailing list has been around longer and has more members. The ARE two seperate entities, a post to one does not go to the other. I'm on both, as are a lot of the other die-hard Drakesters. Both have searchable archives, and I've found lots of good nuggets in the archives.

Hi, I need to dust off a couple of R4 C rx's, and want to know what sort of mods have been brought out over the years? apart from fitting Sherwood 1st and 2nd IF filters, psu and some sort of Guf 1??? can't remember what that one was !

The other thing I've only ever heard/seen one Tr5 hf rig on the air and that was because it belonged to a local guy, I remember it had QSK.
So are these still alive and kicking ??

Topic: 2194 Message: 2207

Hi Garey,

Finally had a chance to look at this thing again tonight- Thanks for the info sheet!

First off, the resistors across T-6 and T-13 are indeed 470 ohm, and not 2.2K. At least THAT is right!

Obviously you know a lot more about these TR-4's than I, but I really think this NB was factory installed. I see no evidence pointing towards an "in the field" installation, or even a trip back to Drake. The NB wiring is tied/laced with the same exact wire with a red and green tracer as the rest of the factory wiring, the faceplate has the blanker markings on it (as opposed to just a hole having been drilled), and every solder joint looks perfect, with absolutely not hint of being re-worked. To top it off, the little terminal strip and grounding lug on the side of the chassis with the two filter caps for the NB board are attached with the exact same rivets used on the RCVR/TCVR switch. My non-NB equipped TR-4 (S/N 29034 versus this S/N 30547) does not have any of this, not even the holes in the chassis where the strip and grounding lug would go).
I don't know when the first noise blankers were available, but is it possible this is just an early example before the plug-in ones were used?

In either case, is there really enough loss through the NBK board that it needs to be removed? The blanker does seem to function fairly well, after all. Perhaps if it was indeed factory installed, there could be a difference from the retro-fitted ones?

Haven't messed with the neutralization problem yet. If it is still screwy with different tubes, I'll swap that cap you mentioned.

When will it end!
Regards,
Chris KC9IEQ

Chris -

OK. Well if you were trying to adjust R24 with a DMM ... :-)

Whoever installed your NB did it wrong. The NBK board is NOT required

and should be removed. The resistors mentioned before are to terminate

the filters and are most likely the incorrect 2.2k rather than the 470

ohms they should be for the separate filters. The trimmer on the NBK board was just peaked on the calibrator signal.

The NB-34 Blanker was designed for the TR-4 with the 470 ohm filters To allow it to be retrofitted into the TR-3 and early TR-4s which used the 'soupcan' and 'one-box' filters, the NBK board was designed to compensate for the higher impedance of those filters, 2.2k ohms. Later TR-4s used the same blanker without the NBK board because it was not required with 470 ohm filter impedance.

I think I have a "notes" sheet on my TR-4 CD that addresses all this.

I agree on the RCA and GE tubes, but they DO work consistently. The GEs seem to drop off in output faster than the other three, but not significantly. If in fact you DO have two tubes of the same manufacturer, perhaps an element support has broken or some other anomaly. The other potential trouble spot is the small disc ceramic capacitor connected across the neutralization cap. It's 12.5 pF, 2000V, NP0.

Mark -

Sounds like an IF stage is oscillating. I would suggest going through with a screwdriver and tightening all mounting hardware, especially on tube sockets and terminal strips. If they seem to be tight, loosen slightly and then re-tighten. While you're doing this, keep your eyes open for anything that doesn't look right, or looks out of place. (Like a piece of wire or something floating around that shouldn't be there!)

If that doesn't resolve the problem, let us know and we can go further.

From: Victor Waddington
Topic: 606 Message: 2210

Hi all
Power suddenly dropped on 40m. Was getting 100w and then dropped to 10w on max gain in key down position. But in 'Tune 'position on max gain I get 60w. The max IC I can get is 150 ma in 'Tune ' and less than 100 ma in key down
On 20m I still get 100w in key down and also 'Tune ' and the IC is OK.
Haven't tried the other bands yet.
Any ideas, please?
Vic

Vic -

Where is the LOAD control set on 40M for max output?

Check C87 for solder condition, connection, etc. Watch for HV!!

Carefully examine the switch sections in the back compartment of the
BAND switch.

If no luck, check the other bands for reference.

Thanks for info.

The load setting was just under the 3 into a dummy load. Tried again this morning (hoping it had gone away!) still the same.

Vic -

A sudden failure like this usually indicates a cracked solder joint. If the problem is ONLY 40M (have you tried other bands yet?), the trouble is most likely in the PA area. There are large wires from the tank coil to the bandswitch wafer in the last compartment under the chassis that are subject to solder cracking from mechanical stress. Of course switch contacts are also subject to corrosion. Poking and prodding with an INSULATED or fiber rod in that area with the transmitter operating into a dummy load will often locate the problem. Watch out for HV!!!!

The tuned circuits for the PreMixer and Driver stages are possible suspects, so careful inspection of switch contacts and solder joints in these areas may find something.

Obviously if you have a scope available it makes it a lot easier to troubleshoot if you can isolate the problem to a particular stage.

It would be worth a quick check just to make sure that the 10W you are getting are REALLY on 40M, and not some other frequency.

2217. Some idears about DRAKE SPR - 4 Trouble

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-06-06 08:11:48 UTC
From: Hans-Joachim Empel
Topic: 2217 Message: 2217

Hello folks ,
i need some good idears.

following problem i have with my DRAKE SPR - 4.

at first , all 23 xtals are in the DRAKE placed.

at some frequencys i can use with the xtals i have no signal.

i was testing the the frequency selector and the cristal selector in several positions , same result.

for example frequency selector to pos.6 MHz , cristal selector in pos.B and turning slowly the preselector from 0 - 10 nothing.

than same frequency , cristal selector in pos.C and turning slowly the preselector from 0 - 10 nothing and so on.

one other thinks it gives me some gray hairs

i receive the 150 to 500 kHz Range with the cristal selector in position 22 , the range switch in position F and the preselector near 10.

the signals are clear and good and stromg , DCF 77 on 77.5 kHz and DWD on 147.5 kHz in RTTY are excellent to receive.

also alle longwave radio stations from europe.

if i take the cristal selector in position A and the frequency selector to position 1 like in the DRAKE - Manual nothing on signal (s) to receive.

Please all idears are welcome to fix the problem (s).

Regards from Germany

Joachim DL2388RB

Good morning from Germany .

so my third SPR - 4 is also running very fine.

i have the SPR - 4s No.327 , No.1445 and No.4385

all three are running on 12 VDC powersorce and they are smooth and cool and absolut frequency stable.

from the receiving sensitivity , they are better as my R8A and R8

i am using my LOG - PERIODIC antenna (TITANEX DLP-18) and i can listen to signals , never before received.

i had a couple of receivers in the past , but the SPR - 4 is like a GUN , smooth adjusted they are better as the most of the

new receivers.

GREAT WORK FROM DRAKE --- FOR ME : DRAKE , RHODE und SCHWARZ and JRC are the best for receivers

i will looking for a fourth SPR - 4 (if the price is accaptable on EPAY sorry EBAY).

only a small question about the Xtals , has anybody an idear how to buy additional Xtals for the SPR - 4 ?????

some offers on EPAY are that high thats already too expensive to buy (25 Dollars for one Xtal is money - robbery)

if anybody have any idear about buying Xtals , please let me know.

Regards and thanks again from Germany

2221. R4 RF Amp Confusion

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-06-13 16:16:02 UTC
From: russellhulett
Topic: 2221 Message: 2221

I recently acquired 2 R-4 receivers, until recently had only tried them on 40M. Tuned the one presently in the operating position to 20M and noticed sensitivity seemed low on 20, 15 and 10 as well. Adjusted the trimmer caps for max S reading of calibrator signal, S-5 was max obtainable on 20. My schematic showed a 12BZ6 for V12 calibrator, so thought to swap. On opening the case, turned out it was a 12BA6 instead.

Checking schematic in the manual for the other R-4 and found the V-12 was shown as a 12BA6. Opened up the other R-4 to borrow V-1 from that radio, but the previous owner had installed a 12BA6 instead. Having read somewhere that the 12BA6 could be subbed for the 12BZ6, I tried it and found the sensitivity on 20 was up above S-9. But, using a 12BA6 will provide a grounded cathode, no bias, because the two type tubes have pins 2 & 7 swapped.

My question, did Drake at some point change V12 from 12BZ6 to 12BA6 or is my first schematic wrong? And, what about using an unbiased 12BA6 instead of the 12BZ6. Finally, what is best source for top quality 12BZ6 tubes? I'm reading that about 1/2 of those tried are no good.

From: Garey Barrell
Topic: 2221 Message: 2223

Curt -

There were at least two versions of the R-4 schematic. The first one was 107640001, 10/7/64, s/n 0001, and showed the 12BZ6 RF Amp (V1) and 12BZ6 Calibrator (V12). This one was circulated in the very early manuals, at least some of which were marked "Preliminary". I had one of the first R-4s, ordered when they were announced, and it in fact had the 12BZ6 at V12. The second version, 29650001, 02/09/65, s/n 0001, showed a 12BZ6 at V1 and a 12BA6 at V12.

The two tubes stayed the same then up through the R-4 and four versions of the R-4A, until the R-4B of 926677000, 9/26/67, s/n 7000 when V1 was changed to a 6BZ6 and the calibrator went solid-state.

There are more than a few R-4s and R-4As that have a 6BZ6 at V1, even thought the chassis was stamped with "12BZ6". The 12BZ6 was an elusive tube, and considerably more expensive than the 6BZ6, even back then. It was a simple change to move one wire to put 6.3 VAC on the V1 filament pin.

The 12BA6 and 12BZ6 "may" be interchanged in "some" circuits, i.e., those where the Suppressor grid is tied directly to the Cathode. The Drake calibrator circuit is NOT one of those circuits!

As for the relative sensitivity of the receiver as determined by the Calibrator signal, you'll find that all Calibrator harmonics are NOT created equal, and that they can vary 10 or more dB from one harmonic to the next, especially on the higher bands. The only sure test of sensitivity is with a calibrated signal generator such as the Elecraft XG-1/2 or the NORCAL S9, in lieu of a "real" calibrated signal generator such as an HP 606A, etc.

I'm not aware of a problem with 12BZ6 tubes. The 12BA6 is subject to grid emission or "gas" which is of little consequence in most circuits, but IS a problem in the IF stages because it loads the AVC line and causes the S-Meter to "drift" around over time. This is why it's sometimes necessary to try a few 12BA6 tubes when replacing V4 and V5.

2229. Wiring a T-UG8 for T4x

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-06-27 21:51:44 UTC
From: russellhulett
Topic: 2229 Message: 2229

Usually operate CW, haven't tried my T-4X with SSB yet. I have an old D-104 with T-UG8 base would like to use, wiring has me a little bumfuzzled.

If anyone has successfully wired a T-UG8 base to a S260 connector for T-4x, would surely appreciate info on the connections made. Of course I want to bypass the preamp.

So, believe the correct method would be to connect T-UG8 white to S-260 tip, red to ring, shield to sleeve. T-UG8 Black remains unconnected. Inside the base, jumper terminal 3 to 8 (to bypass the preamp), remove the battery, set base switch to "E".

Thanks in advance & 73 Curt KB5JO

You do not want to leave the preamp connected in any way. The manual can be found here:

http://www.cbtricks.com/mic_manuals/astatic/astatic_d104_manual.pdf

Move the green wire that comes frm the mic cartridge from pin 3 to pin 8, or better yet, put a 470K resistor in series with the green wire to pin 8. This will improve your audio. Disconnect the white wire that comes from the preamp board to #8. Or, the way I usually do it: lift the white wire from the mic cable from #8, and lift the green wire from the mic cartridge from pin three, solder each to one end of a 470K resistor, and cover with heat shrink tubing. This leaves the mic element active at all times, which allows VOX operation.

Leave the switch in "R". Red is PTT, black is PTT Return (ground), white is mic audio, and shield is mic return (ground). The "E" position is for electronically switched (CB) radios. Wouldn't hurt anything if you used it as you described, but "R" provides the classic wiring scheme for relay switched radios.

> Hi Curt,
Well I can't speak for the r4, but I have 2 r4a's and an r4b.
The 12bz6 tubes are available for the r4 and r4a and my SW4a, but as reported some are no good as new. What I did (as others have done) is to rewire the filament voltage for 6 volts and run 6bz6 tubes, They are plentiful and I have had good luck with replacements. The r4b uses the 6bz6 from new.
I have one r4a that appears to have had 6bz6 from new and my late model 2-c has a 6bz6 (as stamped on the chassis) although the schematic says 12bz6. Try a stupid thing first and see if the filament voltage is 6 or 12 v. Stranger things have happened depending on how long you have owned the radio and if it worked before.

Hi All

I am not the most experienced Drake repair person, so some advise is what I am after.

I bought a R-4C from an original owner, it was in good condition but I did not get a chance to test it before buying it so I guess I am stuck with it

1. I am located in australia, is there a good Drake tech here? I may have to send this one to him.

2. The receiver is about 4dB down in sensitivity and the notch filter has no effect when turned.
The notch filter physically works perfectly, the slug tracks its self without issues.
placing iron then brass into the coil had no effect, this effects the inductance of the coil without touching its settings .
It almost appears not to have a 50KHz oscillator.
I am finding it fun as I do not get a challenge often.

The agc is all over the place when compared to test voltage table in the manual. and my heater 6.3v is 7.0v due to my 250V input voltage.
Is the R-4C particularly sensitive to input voltages
I have a R-4A sitting beside it and it works perfectly.

Anyway any ideas are welcome.

Regards John

Hi folks ,
i have 3 Drake SPR - 4 Receivers , Serial No.372 , Serial No.1445 and
Serial No.4385
i am looking for a fourth DRAKE SPR - 4 receiver.
has anybody some idear , ore offer an DRAKE SPR - 4 receiver for a fair
price.
PLEASE NO EPAY .
i am thinking to buy a DRAKE - R4 HAM - Receiver for the same conditions.
If the Receiver is in not so good conditions , no problem , Serial No.4385
was a pain in the neck ,
before i finished the work and took the Receiver alive.
If somebody has an offer , please feel free and contact me.
Regards from Germany
Joachim

Hi All,

I am in need of copies of the software and manuals for the Drake TNC-270 and DEMOD270. I have the TR-270 radio with the TNC and DEMOD installed, but somehow misplaced the manuals and SW.

I have called Drake, and the parts are no longer available. I will be happy to pay copying, shipping, and handling costs.

BTW the TR-270 is a heck of a one-and-a-half bander. It is a full 2m radio with a 440 receiver. I always get compliments on the transmit audio. TNC works well for APRS and I have copied airline ACARS info in the past.

73 and thanks in advance for any help,

Gene K1NR

Hi all
Am trying to source a Jones socket that will fit the polarised 4 pin jones plug on my TR7 (battery connection next to fan) The minimum oredr trap has beaten me. e.g. found a source in the US where the socket was about $5 but they would impose a $95 surcharge for minimum order plus postage making the cost of 1 socket about $125.
Anyone got one they would sell me or have a better idea, please.
At the momemnt I am using spade connectors from my PSU - I don't have a PS7

Hi Jim

Yep. It was Allied who wanted a surcharge of $100 for a minimum order outside the U.S.

The others were much the same.

I suppose we all have to live with it but this minimum order is getting a bit beyond reason. Yes, I've heard the arguments for it which don't hold up. i.e. 'We have to pay a man to pick it up and then we have to parcel it which involves packaging materials and then we have to send a man down to the Post Office etc. etc. That really doesn't cover a $5 item being turned into $125 or more - and shipping isn't done like that anyway. Just another rip off by dealers.

But thanks for your suggestion.

Cheers

Hello from Germany ,

i am the owner of four DRAKE SPR-4 receivers.
for one of the receivers i am looking for an original main tuning knob. (Serial No. 2112)
has anybody an idear how to buy an original main tuning knob ore know anybody a supplier for good replicas ????
all idears are welcome.

i am looking also for accesory cristal filters for my DRAKE R-4C.
this DRAKE R-4C is in absolute mint conditions and comes from the German Government.
i am looking only for original DRAKE - Parts.

i am interested in following filters :

1. 6 ore 4kHz AM - Filter
2. 500 Hz CW - Filter
3. 250Hz CW - Filter

i am also interested in a NB-4 Noiseblanker.

please no EPAY sometimes the quality is horrable.

i am also happy if i can get some informations about buying the parts for my R-4C

Regards from Germany

2254. TR7A Low Receive Audio at max. volume setting

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-07-26 22:01:50 UTC
From: Roger White
Topic: 2254 Message: 2254

I have two identical TR7A transceivers. When both are receiving with their volume controls set at maximum ON setting (all other controls are identically set between the rigs), one TR7A is noticeably lower in audio than the other. I am listening on their internal speakers. Could there be a problem with the SL61545 audio amp or a component around the part is bad or failing?

Thanks and 73,

Roger W5RDW
Murphy, Texas

The first thing to do before you start digging in would be to remove and re-seat all the boards. As these radios age, oxidized Molex pin connectors start to become a problem. Could also be oxidized switching contacts in the headhphone or external speaker jacks.

Are the S-Meter readings about the same on both radios? Does the problem exist in only one or two modes, or does it follow all modes? Is the audio normal with headphones or an external speaker? Characterising how the radio operates under various conditions compared to the good sample will help isolate the problem area.

2258. Re: [DrakeRadio] TR7A Low Receive Audio at max. volume setting

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-07-27 14:38:58 UTC
From: Roger White
Topic: 2254 Message: 2258

Unfortunately, I don't have any headphones. The TR7 that has the low audio had been repaired for bad PIN diodes and was otherwise looked all over and seems to be OK as far as Pout, sensitivity, etc. I am not sure it had any boards pulled and reseated. Maybe not, if the problem was with the PIN diodes, since I think they are on the a small board that does not plug into any large connectors. Both have very similar S-meter readings across all bands 10 to 80 meters. When both are on the same external speaker, the same low audio is apparent on the TR7 that has the low audio on its internal speaker. The low audio is for all modes, CW, SSB, etc.

Thanks!

From: Jim Shorney
Topic: 2254 Message: 2261

Roger,

You are correct about the PIN diodes, they are in another area. You could still have dirty contacts on the headphone jack, or Molex pin connectors. You didn't mention if you checked AM audio - the audio path is switched by the mode switch between the product detector for SSB/CW/RTTY and the AM detector. If AM audio is normal, you may have a problem in the product detector area, or perhaps the mode switch needs cleaning. If Am audio is also low, look at the mode switch and the audio chain following that, or possibly a fault with T1102. Normal S-Meter readings suggest that everything ahead of T1102 is OK.

My experience with audio PA ICs in general is that they are either good or bad, so the fact that you have audio at all says that the IC is probably good. After checking for dirty/oxidized contacts, I think I would look at electrolytic capacitors in the Q1113/U1101 circuit area. And don't overlook a possible fault with the volume control itself, or the possibility of a mod by a previous owner.

Hope this helps.

>Unfortunately, I don't have any headphones. The TR7 that has the low audio had been repaired for bad PIN diodes and was otherwise looked all over and seems to be OK as far as Pout, sensitivity, etc. I am not sure it had any boards pulled and reseated. Maybe not, if the problem was with the PIN diodes, since I think they are on the a small board that does not plug into any large connectors. Both have very similar S-meter readings across all bands 10 to 80 meters. When both are on the same external speaker, the same low audio is apparent on the TR7 that has the low audio on its internal speaker. The low audio is for all modes, CW, SSB, etc.

Thanks, Jim for a lot of interesting areas to look at. I will follow thru on these.

The radio seems to work just fine otherwise. Yes, I did try the AM mode but did not spend anytime on it other than switch to it once. I will go back and look at it in more detail.

Since you have two of these guys, one good and one bad,
you can do comparitive measurements in the likely areas and
see what is different. This is a very powerful method of
trouble shooting. Look at both AC and DC voltages. If you
have a decent scope use that.
Also, someone mentioned the headphone jack. Even if you
don't have a pair of phones you can work the jack with any
plug that will fit. That will sometimes clear a dirty
normaling contact. Also, just measure the voltage at the
jack.

Very good ideas indeed!. Many thanks. Yes, I will compare both of them.

I do not have a scope, but think I can get one on loan from our ham club.

No problem at all Vic. Been running mine that way for over 4 years now ever since I got them from Antique Electronic Supply. The only difference I think is that the "A" has a quicker heater warm up time.

Much obliged Wink.

Wasn't sure if there were different internal connections on each tube which may have involved altering pin layout.

Have just ordered a couple of 6JB6A's from Antique at quite an amazing price (cheap) but there is a single 6JB6A on Ebay (NOS) and the guy also has a NOS 6JB6. Both of these are far less than what I can buy them here - including shipping but wasn't sure if they could be mixed. Might as well get a couple of spares whilst they are still available.

Tnx agan

Hi
Can anyone tell me the make and part No. of the 4 socket(with hole for male locator pin) female connector for a battery to the TR7. The No. I have in the manual is S-404-cct (Cinch- Jones) but I understand this No. has now changed.
I have searched Cinch Jones, Molex etc but don't seem to come up with the right part.
I seem to be making a hash of things so accurate info would definitely help.

I am building my own cabinet. I am using 3/4" Plywood. The AC-4 measures 10" long so I cut my base 12" long. The original idea had been to attach the sides to the side of the base leaving 1" clearance on each side of the power supply. Well . . . "The best laid plans of mice and men . . ." the sides are going on top of the base cutting my clearance to 1/4" per side. Here is my question: Would a muffin fan on top, be unnecessary over kill, or would the reduction in clearance produce more heat and need cooling? There are pictures of the first mock up @ http://forrest.3h.com/AC-3%20PS%20cabinet.html Thanks in advance for any help.

Hi

If you have got some board left, also patience, why not build another to the same spec as the the MS-4 ? If you build a cabinet with L 11.75" x W 10.75" x H 5.5" - these are internal measurements so add .75" to all the dimensions for external measurements with your 3/4 board.

It will be much easier to fit a speaker if you leave out the front panel, find a piece of grill meshing (you can spray that up) and hey presto!

Cheers

Vic

2275. Fw: TR7A Low Receive Audio at max. volume setting...Update 8/3/2009

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-08-03 21:59:14 UTC
From: Roger White
Topic: 2275 Message: 2275

I have narrowed down the problem in my TR7A with low audio. Since I have another TR7 that is working correctly (nice loud audio at max Audio Gain setting), I started to swap boards that were easily swapped (no unsoldering of cables, wires...). I first swapped the 2nd IF/AGC Board with no improvement. I then swapped the IF Selectivity board with no improvements. Then I swapped the Passband Tuning Reference Assembly. I then noticed the low audio immediately became good, loud audio and the other TR7 (the good one) had low audio with the board that came out of the low audio TR7. . Well I am making progress. I need to next see if I can determine if this board is not adjusted properly. I have the Service Manual for the TR7 so maybe that will shed some light. I am not yet ready to tweak coils, pots, etc.....!

Subject: TR7A Low Receive Audio at max. volume setting

I have two identical TR7A transceivers. When both are receiving with their volume controls set at maximum ON setting (all other controls are identically set between the rigs), one TR7A is noticeably lower in audio than the other. I am listening on their internal speakers. Could there be a problem with the SL61545 audio amp or a component around the part is bad or failing?

Thanks and 73,

Roger W5RDW

Interesting. I wonder if it has something to do with BFO or some other oscillator injection level? Thanks for sharing that info, Roger.

Again, since you have one good one and one bad one you
can compare levels at appropriate points on the boards
(assuming the test points are reachable). That should be a
big help in isolating the problem. Check for both AC and DC.

2278. [DrakeRadio] Fw: TR7A Low Receive Audio ....Sort of non technical solution .....

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-08-04 01:49:36 UTC
From: Roger White
Topic: 2278 Message: 2278

I got brave and took out the old trusty tweaker and stared at the 5 tunable coils I could easily see on the edge of the Passband Tuning Reference Assembly. They looked too tempting to just leave alone and first read the manual. I was not going to turn them more than one turn anyway before I read the manual. I started by chance at the coil on the right (L1012, the front panel is toward me). I tweaked it about 1/2 turn. The audio level went down. I turned it back and then the other way and the audio level went up. I went to the next one L1011, then L1009, then L1001 and finally L1006 until the audio level was much louder (with the calibrator on and also just listening at the noise level). L1012 had the greatest effect and I guess it was mistuned the most. I had both radios into an antenna thru a switch and set both radios identically as far as the front panel knobs. The AF gain was at 12 o'clock. Now the audio was at best I could tell identical for both radios (I also listened to the 14.300 MHz net which is always on) and both radios were the same volume at identical front panel settings. So far, I have not screwed up anything that I can tell (as far as the received audio is concerned). I never turned any coil slug more than 1 turn, L1012 was turned the most. The others were just touched up slightly. On down the road, I will get more technical, read the service manual and go thru the alignment procedure when I have nothing else better to do. I did not touch the little tunable cap C1030, which tunes the 8.050 MHz signal. Best I wait until I have a counter set up. I also could never find L1011 or L1012 on the schematic. I did find L1102 and L1101. Guess they labeled them wrong.

L1001 is the 40 MHz oscillator adjust. That one will need to be set accurately.
Also L1005, the 13.695 adjustment.

I'm glad you found the problem, that's good info. Thanks for passing it along.
That radio must have been in the hands of a "golden screwdriver". Now, get into
that service manual and go through the adjustments in the proper sequence! That
is critical to proper operation of the radio, as one improper adjustment can
throw off all the others that follow it. I would suggest starting at the
beginning, and be sure to check the +10v with an accurate voltmeter - the +10v
helps set the character of the whole radio, and will affect other adjustments
down the line. The S-Meter/AGC can be fun too, I did a web page on that one:

http://radiojim.exofire.net/pages/TR7_2IFA.html

I need to revise it again, I have some more data points. But it's a good
start.... If you don't have access to a calibrated signal generator, use the
service manual procedure (or just leave well enough alone if the S-Meter
performance is acceptable). The pedestal adjustment should be checked if you
adjust the +10v regulator.

Ok, thanks Jim. Yes, I will do it right the "second time". Hi Hi.....I just pulled up your web page. Very nice. Thought I had seen all the TR7 sites but will for sure add yours to my list.

In looking at your site, that reminds me one of my TR7A has a very low level LED display. It is the one that has not been toughed by anyone, owned by a former Kahoona at the Drake factory years ago. In looking at it, I can tell it has not been touched as all of the solder joints look as if they were brand new. The other TR7A has a number of tell tell signs of a soldering iron repair/mod here and there.

I also have a L-7 I love, so will read your section on it also.

Thanks, Roger. I guess it's sort of "under the radar" still. I've got more stuff planned, some of which has already been posted to the Drakelist reflector/online forum in text form. As time permits. I need about a 6 month vacation....

>In looking at your site, that reminds me one of my TR7A has a very low level LED display.

I think there were variations in the display brighness over the production life, plus they tend to lose brightness as the number of hours goes up. My R7A is brighter than some of the old TR7s I have seen. Have seen the replacement LED units made by Willi DF4NW? The blue one I put in my TR7 looks really sharp - the pics don't do it justice.

From: lratcliff lratcliff
Topic: 2282 Message: 2282

This Drake TR-7A is a TR-7 that was factory upgraded to an A. It does have the 3 piece back panel.

Included is the TR-7A, a PS-7 power supply, FA-7 cooling fan, 300hz CW filter, 6Khz AM filter, 1.8Khz SSB filter, and 7077 desk mic. Everything works great. Only blimishes I can find is a small scratch near the mic connector, and a scuff on the top, where another piece of equipment was sat on top of it.

Im asking $650 obo plus shipping. We are looking at abt 51# before packing. I will consider local pickup near Pulaski, VA.

Here are the photos.
http://www.flickr.com/photos/41218546@N07/sets/72157621975084868/ The top looks better than it shows in the pic.

The company that originally painted the Drake cabinets is still in
business in Miamisburg, OH::

For those who are interested in original Drake paint. That is a true
baked powder coat finish, two part system and much more durable than a
spray can job. The place to call is Hartzell Mfg
<http://www.hartzellmfg.com/>. in Miamisburg, OH at 513-859-5955.
vickroy@... <mailto:vickroy@...> They can
repaint your cabinets to like new condition.

Early Drake 2A. This is a analog tube reciever covering 3.5-4.1, 6.9-7.5, 13.9-14 5, 20.9-21.5, and 28.5-29.5 MHZ in addition to 7 additional empty slots. Just putting crystals in empty slots you can get the WARC Bands. The bandwidth values are 4.8, 2.4 khz-6db. Features: 1/4 inchheadphone jack, S-Meter, RF Gain, AVC SLOW/FAST, Preselector, Mute Line, BFO, Dial Set, Diode/Productor Detector, NL. Requires a speaker. 12 x 7 x 9 inches 14.5 Lbs. 120 VAC 60 Hz 40 watts. Early serial number 519.

Also includes new can capacitor from Hayseed Sales, has all new tubes. Fair shape, but could use a tune up. copper chassis in fair shape, needs a cleaning. Listening to 40m 3905 Century Club net as I type this. Due to its age unit is sold ASIS!

Would like $90 plus shipping.

Jerry - NR5A

Depends on what you want to do. The 444 is an excellent, natural sounding mic for general operation. For contesting an DXing, a properly tweaked D-104 (non-amplified) will give a little bit more "edge" to your audio. I've used both, and wouldn't turn down a 444.

Dual impedance (set to high impedance) or high impedance only will work.

>And what plug does the T4XB need for this mic?

A .206 three-conductor. Looks like a 1/4" stereo plug, but isn't - it measures .206 OD instead of .250. They are usually available from some of the internet Drake gurus, or are often seen on eBay advrertised as "Collins" plugs. If you have a good local parts jobber, they may be able to get you one as well.

The military designator is PJ 068. I was able to find
some by doing a Google search for this.
http://www.flyaas.com/acatalog/Online_Catalogue_PLUGS_JACKS_20.html

http://www.airsource1.com/catalog.cgi?c=HEADSET%20PARTS&i=ELESWC-480

http://www.sonetronics.com/products_detail.php?intIdProduct=59

Above does not seem to list a price.

I thought Switchcraft still made these but the only .206
plug I could find on their site is a mono (sleeve and tip)
type.
My T-4XB was modified some time in its life with a
standard 1/4" RTS stereo jack. This is a great convenience
because plugs, even right angle ones, are readily available
and cheap. It does not look like a difficult job to do.

Yeah, I've got a bunch of those stashed around here somewhere.... Never used one. Odd looking devils, they don't look like the SwitchCraft .206 at all, but they do work.

It's not at all. I think I converted an old Galaxy once. I suspect the rationale behind using the .206 connector was to prevent the op from accidentally plugging phones or CW key into the Mic jack. I've kept mine original, the plugs aren't that hard to find. Usually a query on the Drakelist reflector will turn up one or two.

Date: 2009-08-16 15:36:50 UTC
From: jshea_n4dsp
Topic: 2293 Message: 2293

Hello.
Like to hear everyone's suggestions on what they use and where they purchase the dial and S meter filters for the Drakes. Not only the blue filters but the white as well. And any other suggestions that would be helpful in changing mine out.

Thank You.

john

Hi John,

Well, in my 7-Line, I just replaced the dial lamps with blue LEDs. Problem solved. In my C-line, I used the plastic colored Roledex card covers, but I don't know if they are still available. There's also been some discussion lately of the white background having yellowed over the years, requiring a repaint to make it pure white again, as being a root cause of the greenishness.

You can probably find every answer there ever was to this question in the Drakelist archive.

http://www.mail-archive.com/search?l=drakelist%40zerobeat.net&q=blue+filters

Hello all
Anybody have any info on Garey Barrel?
Last I heard (several weeks ago) he was in in hospital for surgery of some kind but haven't heard anything since.
Kinda miss his presence and unstinting advice.

2298. Cleaning the Pots

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-08-18 01:31:06 UTC
From: jshea_n4dsp
Topic: 2298 Message: 2298

Tomorrow the wafer switches on my R4B are going to be cleaned and lubed thanks to the excellent article by Mark Gilger, WB0IQK and while I have the covers off I just as well may do the PTO because someone oiled the nylon gears thinking it would make it "silky smooth"! Being a clock repairman I see this all the time in Grandfather Clocks. The only way to clean it is a total dismantle of the movement and immersion in a chemical solution.

But my question refers to the pots such as the AF Gain, RF Gain, etc. Back in my novice days in the late 60's we used "pot spray cleaners". Is there something out there to clean the pots today or is that considered a bad practice today?

thank you

john

My usual approach these days is an alcohol flush, followed by a sparing application of Radio Shack contact cleaner with lubricant to keep the wiper lubricated. Be careful with this stuff, it wants to go everywhere and you end up with a film of lubricant in spots that you don't need it. A modified turkey baster works pretty well as a syringe to get alcohol into the pot. I've been meaning to try this for alcohol delivery, but havn't got a round tuit:

http://www.harborfreight.com/cpi/ctaf/displayitem.taf?Itemnumber=65297

Stiff shafts are another story. A drop of PTFE based oil worked into the shaft sometimes helps. I had one unit that was so bad that I had to completely disassemble the pots, clean and re-lube the shafts with PTFE based grease. They are smooth as silk now. That was a Heath SB-620, if anyone cares.

2300. TR4 - loose wire...

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-08-18 15:07:54 UTC
From: caviloso
Topic: 2300 Message: 2300

Hello!

I am the PU1WJH, QRA Ricardo, of Rio de Janeiro, Brasil.

I have a "Drake TR4" serial 27271, and similarly, more than 16 years did not call the transceiver that was packed.

For over 17 years I am QRT, but I am claiming back the activities of HAM as soon as possible.

However I noticed that there is a "loose wire", white/brown, in the vicinity of V13 (12AX7A), V16 and V2.

Someone could help me, please?

I thank in advance.

Muinto Bem Ricardo, e Boa Tarde,

Faz muinto tempo então melhor em Ingles! :>)

If you plug in the radio does it work? The problem may show up that way to identify where it is supposed to be.

These loose wires are a difficult problem. I had one and all I did was to move the wire around at it full length to see which soldering places it could have come from. Then, using a lens (magnifier) I looked to see if there was a broken piece. I tested that with a jumper wire.

Another approach is to trace the wire back to where it is still attached and try to guess its use. Very difficult.

One ham sells a CD with all of the wiring photos from Drake Service manuals. His web site is : http://www.k4oah.com/ He (Garey Barrell) is a very nice guy and he helped me via email many times. He is not well, he was in the hospital, but is now recovering.

Here is a URL with a review of those CDs

http://www.eham.net/reviews/detail/8008

I have those from my TR-4cw/rit.

There may be some hams on here who will know exactly what the wire is. You could take a photo and send it too.

In my Drake TR-4CW the white/brown wire is connected to V13-1.
If this is disconnected, the transmitter AGC will not work.
When you transmit, the S-meter indicates the transmitter AGC.
Does this meter show any change when you increase your audio
during transmitting?

2303. TR-4 Front Panel Screws

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-08-21 14:19:56 UTC
From: qrp17mssb
Topic: 2303 Message: 2303

Are the four screws that hold the front panel to the sub-panel the same as the cabinet screws. I believe the cabinet screws are 6-32 with a black finish. In several photos I have recently been reviewing it appears the front panel screws are 4-40's. Any one know the size (4-40 or 6-32) and the length? McMaster Carr has the screws I just need to know which ones.

Hi Vic,

Thanks for your reply! It looked like they were smaller but I thought I would ask. Someone on the list offered to send me some. As long as I know the size I have a source other than those offered to me. I know there is about a 1/16 inch spacer between the front panel and the sub-panel thus my question about the length. Figuring 1/16 for the panel plus 1/16 for the spacer makes 1/8 inch figure at least 1/8 inch into the sub-panel so it looks like 1/4 inch in length should do it.

Thank you again.

Cheers and 73's

2310. TR7

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-08-23 10:35:51 UTC
From: victorwaddington
Topic: 855 Message: 2310

Hi
Got a problem with TR7. I don't have a cct. dia or a sevice manual.
Problem is this.
I run it from a 30amp PSU to the 4 pin Cinch-Jones next to the fan (I don't have a PS7) and it has always worked OK.
The top right and top left pins are for the high current (Tx) and the bottom two for the Rx.
During the course of a QSO it packed in. Now I am left with a strange situation. If I disconnect the Jones plug my PSU meter shows 13.8v and Nil current - which it should. But even with the rig switched off if I connect it to the PSU the meters on the PSU flicker around 6v and show a current drain of 2 to 3 amps - and the rig is switched off!!
If I connect a supply to the Rx pins only the Rx works fine.
So any ideas why the PSU is OK when disconnected from the rig but goes awry when connected even though the rig is switched off?
Vic

Topic: 2300 Message: 2311

Hi!

Hello!

Thank you for the kindness of dear HAMs.

The information was very useful.

As the TR4 was unused for 19 years, I decided to do a survey to cold throughout the chassis to prevent bigger problems.

Now, after restoring the electrolytic high voltage source, turn-on the TR4 but only clicks on the speaker.

There were 4 soldering oxiddas and filaments of two tubes (6JB6 & 6BZ6) not lit.

After 4 days of revision could make the TR4 back to work, but only with good yield at 40 and 80 meters.

(I have only one 6EV7 tube, I have no one to replacement...)

Here, in Brasil, We have serious difficult to find tubes.

Thank you again.

Are you replacing pairs of 6JB6 tubes in a T-4X without realignment?
When I replace 6JB6 tubes in my TR-4CW, I always realign the driver
grid and plate adjustments. It makes a big difference on 15 and 10
meter output power especially when I switch between different brand
tubes. After doing those adjustments at low power, I also touch up
those same adjustments at full power. Adjust the final bias current
and the final neutralization also after swapping tubes.

You have a low impedance sink somewhere in the Tx section of the TR7 - if I were you I would check the connector, both the plug and the socket then follow the circuit with an ohm-meter to where the resistance is very low - have a feeling that it might be a capacitor

This will be a challenge without a manual - I have mine on a CD and can email you some of the pages - send me your email address

Grant

Radio Shack used to sell a 5x7 for under $20, I believe. It can be wired for 4, 8, or 16 ohms, and will handle 10 watts of audio power. The RS part number is 40-1261C.

I got one off of the famous auction site several months ago for around $12, new in the box.

Hello Grant

My email is g4jss@....

Re the fault. The PSU is definitely OK and have also tried on another PSU and get the same fault.

In my ignorance I seem to think that the fault lies between the Jones connector and the on off switch on the rig as the PSU voltage drops to 6v and the PSU meter shows a drain of several amps without the rig being switched on. This only happens on the high current cct. (Tx) If I connect to the Rx cct only the Rx works fine.

Are there any RF decoupling caps associated with the connector and prior to the switch?

I have no idea which pages I would require but bearing in mind the nature of the fault you may be able to assist with that.

Your offer and assistance is very much appreciated.

The TR7 service manual can be found on the internet for free download in a couple of places.

Can't say for sure. I found them through search engines, and discarded the URLs after I downloaded them. There seemed to be two variants, not the greatest scans, but usable. Start with mods.dk, then head to Google (or your search engine of choice).

I also have the version on CD from Hammanuals, and it is very good. But there are at least two known versions of the service manual.

I bought an original late TR7 service manual on eBay some time ago and it included the diagrams and layouts for the various versions of the boards. I mention that only because it was news to me when I received the manual, and there's nothing like having the original photographs and large fold-out diagrams.

Got one of those, too (early rev). :) Along with a very nice repro that I completely forgot about until I stumbled across it.

The high current rail does not connect to the power switch, it runs directly to
the PA deck and nowhere else.

>Are there any RF decoupling caps associated with the connector and prior to the switch?

There are both RF bypass and electrolytics on the PS deck, and possible on the
back of the JOnes connector itself (I haven' t looked lately).

2331. RV-4C trouble

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-08-27 03:44:23 UTC
From: lonelyone_64109
Topic: 2331 Message: 2331

While moving the station this weekend the RV-4C VFO has quit working in receive & receive/transmit positions (no tune or calibrate signal but dial lights and neon light is lit. I don't hear the VFO signal on a SW receiver but can hear the VFO in the TR-4C. I did the voltage and resistance checks and the resistances are fine. However the cathode voltage is missing on the tube in the VFO. None of the parts in the VFO look bad or burnt, from what I have checked they are fine.L3 tests good and I tried touching up the solder joints thinking it may be a solder joint that got loosened up. I have sprayed the switch with De-OxIt. Even swapped out the tube without luck.Any ideas???

The crazy thing is it was working fine a couple of weeks ago. Maybe I should have left it alone???

After looking at the diagram for the PA board one must think that the electrolytics are suspect. Because the power switch is in the off position there is no bias on the high current transistors and the only path to ground that I could see in a cursory pass is in the electrolytic caps, the bypass caps, and the resistors. High likelihood that at least one of those will prove to be the culprit.

best of luck, Vic

Grant

Also worth checking are the driver transistors - I've had them go leaky on me.
The PS transistors possibly as well, but less likely from what I have seen and
read.

Have you checked the relay in the TR-4? The neon light on the RV-4 should toggle on and off as appropriate in RX only or TX only. Check the coax cable that carries the RV-4 signal back to the TR-4. I've had to replace this cable in three RV-4s that I've worked on - all had open center conductors. Also look carefully at the inside of the Jones plug that plugs into the bottom of the TR-4. Space is very tight and the insulation sleeves over the pins can deteriorate over time. You may have a short there.

I have a Drake TR-7 that I did have for sale. I opened it up to answer a question for a buyer, and now it will not recieve or transmit. I pulled the NB and the Second Mixer board. All contections have been checked and double checked. I reseated all boards and conections that I could find.

Any ideas where to start?

Lee

It might be helpful to know what the radio DOES do. Does the frequency readout respond normally to PTO and bandswitch operation? Do you hear hiss from the speaker? Does the S-Meter respond to antenna signals or the calibrator signal? Does the T/R relay click when you PTT the mic?

The most common cause of sudden failures in the TR7 seems to be oxidation or dirt in the Molex connectors between the sub-boards and the parent board or DR7 board, or a poorly seated board. You have already checked that, but it might pay to check it again; some of the boards aren't real easy to properly seat. Also check all the small plug-in cables between boards to ensure that they are proplerly mated with the connectors. The wire from the DR7 board and the coax that passes through the DR7, both connecting to one of the bandswitch sections, are also critical. You might also want to check teh DC-DC converter board in the right front corner of the radio for proper output voltages. Be careful not to bump any of the adjustment pots, or you will need to realign them.

It powers up, and shows all inclination of working correctly, but will
not recieve any signals at all. Not even with the calibrator on.
Also, the relay will switch over, but no output on any band or mode.

If the digital readout responds normally, that indicates that all the oscillators are running and locked. Which means the DC-DC converter is probably OK, as well as the +10. I would start looking at mixers and IF chain. And don't everlook those Molex connectors. The pins can become deformed or the female contacts lose thier "spring". All this is fixable.

If you don't have one, download a service manual. There's a couple of them floating around on the internet for free. Mods.dk has one.

I to have an Oscope. Is there a good way to trace signals from board
to board? Im thinking at the ends of the coax that runs from each
board.

I think I already have a service manuel for it, I will have to look.

O-scope should work fine, depending on the bandwidth. The 2nd if is 5.645 MHz. 1st is 40 MHz. Many of the critical signals are available on the bottom of the parent board. The cables that lug in near the top of the boards should be easy to probe, others not so. I would almost guess, based on your description of the symptoms, that you are losing injection somewhere. If you have a general coverage receiver, you could sniff the 2nd IF with it and see if that is working, at least. You should be able to hear yourself on transmit.

It's significant that you cannot hear the calibrator signal and tha neither the rcvr nor xmtr function.

I had a similar problem after brining my TR-7 into the houe after it sat for almost 9 yrs in a leaky shed. I reseated all the cards and spent many hours trying to track the problem - no reception no xmsn.

After nearly giving up I reseated the cards again and noticed that one pin was slightly bent on the connector for the mixer board - had to look carefully to it - straightened the pin and it worked perfecty - these things are robust! still working with no problem at all.

Check the pins carefully and be GENTLE when manipulating the boards - they can be troublesome and they demand respect.

AFter you assure that the pins are ok and the boards are correctly seated look into the calibrator - that's a good test signal.

Could be the same problem that I had - mine involved the mixer

best pf luck

Grant

I am leaning toward the problem being with the mixer, since I did pull
it out also. Will check that out later today or tomorrow, and see
what happens.

A couple of thoughts on the Molex connectors. The femalr contacts can lose thier spring tension. The best fix I have found for that (short of replacing the connector) is to desolder the connector from the board, carefully remove the contact and re-tension it.

My R7A had a solder blob from the factory on one of the male pins. It worked fine that way for many years before I got the radio and started reseating boards, at which point it deformed the female contact. After cleaning the male pin, I used the above procedure to re-form the female contact and all was well.

The interconnect coax cables can be fun too. The solid center conducter has to mate with a very small socket contact soldered to the board. It's not always easy to "hit the hole", as it were. A good visual inspection, with a flashlight in hand, will tell the tale.

I know all about the coax connectors. I have had a fit with them in
the past. Is there any history of the center connector breaking up
inside the cable?

Not that I have heard of. I've had my TR7 since about the mid 1980s, and the poor girl has suffered considerable abuse at my hands. :) Haven't had any problems with the cables. Molex connectors, driver transistors, filter caps on the DC-DC converter, yes. Cables, no.

My current niggle is my CW sidetone tends to disappear. Not a big deal, I don't run much CW. I suspect (you guessed it) a Molex connector...

All in all, over the life of the radio, that's not a bad record.

From: david.rose@snet.net
Topic: 2337 Message: 2348

The TR-7 I bought earlier this year has been acting up recently and I'm wondering if anyone out there has seen this happen. When I advance the carrier control past the 1 o'clock position and transmit, the unit shuts off and it takes a moment or to before I can turn it on again. At 1 o'clock and below no problem. Also the green ALC light when starting a transmission (cw) starts out a bright green and slowly fades and goes out. Can anybody out there tell me if this normal? Thanks!

Hi Dave,

Are you using the matching PS7 power supply? What is your corresponding output power at the point of shutdown? There may be an issue with the PS7, see http://www.alg.myzen.co.uk/radio/tr7/mods.htm#16 , and #17 immediatly following it. I would tend to suspect the adjustment of the white pot first.

The ALC circuit can be a little strange. I would highly recommend the ALC modification farther down on the same page as above. Does your power output remain constant, or does it fall off after a few seconds? This could indicate a fault in the PA deck. The predriver transistor on the Ver. 2 predriver board has been known to cause power falloff. There is good information on this in the "Drakemods" article and at the WB4HFN web site. In any case, for best signal quality, the rig should be run so that you are *just below* the ALC threshold; i.e., just below the point where the LED starts to illuminate.

Hope this helps.

Good evening Jim and thanks for your reply. Yes I am using the matching PS-7 supply and on 40m, the output stays at a steady 100W. I bookmarked the link you had sent me and will check it out. I am waiting for a second TR-7 that I purchased recently and when I get it will try the PS0-7 with the newly acquired TR-7 to see what happens. Many thanks my friend!

Jim & Keith,

Thanks to both of you for your suggestions and Keith you'll be glad to know that because of your suggesting to check the coax connector has resulted in both problems being fixed. I now can set carries ro full clockwise position with NO shutdown of rig and ALC light stays on. I will keep carrier setting at best position, probably at one o'clock. So again thanks to you both.

Its fixed. I reseated the 2nd mixer board again, and it sprang to
life. I had already reseated that board several times before, with no
joy.

TNX for all the help.

Lee

2356. Looking for SPR-4 Power Cable

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-09-06 14:30:43 UTC
From: wb5kye100
Topic: 2356 Message: 2356

Hi..
I am helping a friend track down either a cable for the Drake SPR-4 or a source for the mating connector to build his own. Does anyone have a spare or know where I may find what I am looking for?

I've placed a picture of the receptacle on the back panel of the SPR-4 in the *FILES* section under WB5KYE. Any help that you can offer would be appreciated.

Thanks
Jim

From: DrakeRadio@yahoogroups.com
Topic: 206 Message: 2358

All group memebers are welcome to post here on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others (what you put into this group you will get back so participate if you have a chance). Although we would like to focus on Drake Radio subject matter any Ham Radio subject matter is allowed. This includes any QST's of events or hamfests, especially if Drake radios are included

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our groups home page, as well as links to Drake information or your homepage.
Thanks to all members for your particapation.

2360. Re: TR-7 problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-09-12 12:33:46 UTC
From: wd9cmd
Topic: 2337 Message: 2360

Hi,
I'm new to the group, but a long time Drake owner-operator. When re-seating the boards in the TR7, I recommend using some deoxit either on the pins or the board contacts themselves or both. These radios are getting some age on them, and board contacts are the first things to check if something goes wrong. Other common problems are the ground tabs on the boards not making good contact to the rear cover.
Good luck,
David

2361. "Unobtanium" plug for Drake, plus other Drake items FS

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-09-12 20:09:36 UTC
From: Ken Simpson, W8EK
Topic: 2361 Message: 2361

Drake items for sale:

"Unobtanium" 3 pin mic plug
This is the small 3 pin mic plug that fits the Drake TR-22
mic jack. It is much smaller than most of the mic connectors.
I thought these were completely gone, but one appeared from
a silent key. This one has been used, but should still be
usable some more. $12

Drake 1525 EM Touchtone DTMF Microphone
This is the mic that was used to add a touchtone pad to many
rigs in the 70s and 80s. It is a normal hand mic from the
front, but has a touchtone pad on the back. Four pin mic plug.
This particular unit has been used, but is in good shape and
includes paper work. $38

Drake TV-3300-LP Low Pass Filter
This is a modern low pass filter to go between your transmitter
and antenna, and has been optimized to have more attenuation
in the 40 MHz region, where many TVs have their IF. It is good
for 1000 Watts "average" according to the manual, and has
over 80 db attenuation at 41 MHz. This one looks great, and
includes the paper work. $30

Case for Drake TR-33 C
This is the black case that fits the Drake TR-33 C, and has
cutouts in the back for antenna, power, etc. It includes
the shoulder strap, and is in good shape. $12

Case for Drake TR-22
As above, but for the TR-22. No shoulder strap. $10

Prices do not include shipping from Florida.

Thanks.

2362. TA-4 ADAPTER FOR SPR4- AUDIO TRANSFORMER

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-09-13 06:08:02 UTC
From: w1fued@sbcglobal.net
Topic: 2362 Message: 2362

Hi All,

I have an SPR4 WITHOUT A TA-4 BOARD. I found the schematic and info online and wish to build one, but cant find any info on the audio transformer needed. Does anyone know the impedence of thiat transformer? Is the anti-vox necessary for PTT or cw?

I will build up the board for use with the digital display I built and try it, but would like to complete it with the transformer if possible.

I just replaced a 1000mFd capacitor in a small regulated power supply
last week. It had a working voltage of at least 35V. It's sealed up
now so I can't see the exact voltage value. I bought it at Radio Shack.

15v 1000?F is an odd voltage for most common use today, unless it's a Tantalum cap that require precise cut off voltage. But a 16v 1000?F cap is very common and can be found in almost any component supplier store. A 25v 1000?F cap will also work, if you are not cramped for room, all these are available in common domestic and amateur power supplies circuits, and parts box.

online order from Digikey, Mouser, MCM, Jameco, or any of the amateur parts guys.

This does sound like an odd value from an older receiver. Be sure it is an electrolytic and not a polarized tantulum as mentioned before. Perhaps a picture?

It shouldn't cost more than a buck.

I have a 16V 1000mFD I'de be happy to send you a couple if you want to cover a priority flate rate or regular postage. Only thing is I only have radial mounts. ie both leads come out of one end--for pcb mounting. Works the same, but if you are just experimenting, its fine.

They are .375 dia x .625 long.

email me off list--KU8L@...

Cheers
Curt

Date: 2009-09-19 08:35:09 UTC
From: Victor
Topic: 1070 Message: 2370

Hi can anyone tell me what the going price is for an R-4B?
I ask because there is one on Ebay UK and he wants $720 for it plus $30 shipping.
That seems very high to me especially as it ' worked when I last used it ' so he doesn't know if it works or not and he also suggests that before use the electrolytics should be checked. That seems to tell me that it hasn't been used for a long time and he's wary about switching it on!

Vic,

$720USD!...Run Away!

Maybe $250-$300USD IF it is a late serial number (which it isn't). He has no photos of the copper chassis to show what condition it is in. Also, the dials will discolor if exposed to direct sunlight and is a common issue with the B-Line (can't tell if the whole dial is clear from the photos).

I have been looking for one here on ebay for the last two months that is in good physical shape and in the later serial number group (10501 - 16000). The ones I have SEEN listed actually sold closer to $280 - $300. Condition seems to be more important to how much they sell for. Because of the copper plating some look very good and some very bad. I'm a little short of cash right now so I have only been keeping track of what they are selling for.

As the old saying goes, "You can't blame 'm for trying."

Often your see extravagant "Buy Now" prices on eBay and you wonder just what is going on in the "advertising department." IMHO eBay does serve as a source for an idea of what is going on price wise in the US. However, I like WB4HFN's
http://www.wb4hfn.com/DRAKE/DrakeSalePriceHistory.htm
for price ranges.

What happens in other countries is another story - shipping and customs ad a lot of cost and aggrevation that has to be worth something!

Speaking of the copper.....

IF you are lucky enough to live in a town that has two businesses, you can bring your copper of to new standards.

First, find a printing outfit that can make a silk screen for you. And then a plating outfit that can do copper plating.

Strip your chassis and take it into the print store. They will take pictures of all the tube nomenclature and placement and print type (Font) and make a silk screen for you.

Then off to the replater, where they will strip the old chassis and replate with shiny new copper plating. When done, take the silk screen you had made, tape it to the chassis and reprint the tube info..then when dry, coat with a good clear coat of whatever you choose and your legacy radio will look top notch. Cost is a little on the high side but well worth it as the early Drakes are truly worthy of being on display as well as being in use!

Subject: [DrakeRadio] Re: R-4B

I have been looking for one here on ebay for the last two months that is in good physical shape and in the later serial number group (10501 - 16000). The ones I have SEEN listed actually sold closer to $280 - $300. Condition seems to be more important to how much they sell for. Because of the copper plating some look very good and some very bad. I'm a little short of cash right now so I have only been keeping track of what they are selling for.

2378. Wiring Shure 444 for R4B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-09-19 17:14:07 UTC
From: jshea_n4dsp
Topic: 2378 Message: 2378

Can someone tell me the wiring configuration for a 1/4" phono jack for the R4B using the Shure 444 for PTT and Vox.

There is 3 wires, Red, Black, White, and the braided ground.

thanks

john

>There is 3 wires, Red, Black, White, and the braided ground.

If the mic hasn't been re-wired:

Red = PTT
Black = PTT return
White = Audio
Braid = Audio return (shield)

Red probably goes to tip, white to ring (check your manual on this). Tie black and shield together and connect to the ground terminal. Depending on the 444 variant you have, the audio may or may not be enabled in RX mode. If not, there should be a switch on the bottom of the mic to open the PTT line when you want to use VOX. It varies. You may need to open it up to see how it is wired.

Why would you be using a mic with a receiver?

Just asking..... :)

The mic plug for the Drake 4-line transmitters is slightly smaller than
1/4" -- .204", I think. Unless someone has changed out the mic jack on
the transmitter, a 1/4" plug won't work.

LOTS of people caught that. I wasn't one of them. Never having owned a 301, I didn't really look all that close. Was just enjoying the movie.

I did enlighten IMDB on this little thing called "VOX", however.

Topic: 2387 Message: 2387

I have a problem after i tune up on any frequency on 75 meters. my problem is after tuneup and return it back to the SSB mode on the transmitter with the transceive switch in the separate mode the receive goes way off freq and if i turn the mode switch on the R-4C to AM and back to SSB it comes right back on frequency. Im useing the full C line. R-4C T-4XC MN2000 matcher and the W4 watt meter. I have the L-4B but im not using it when this happens. I checked for RF in the shack and that is not a problem. Also im using the shure 444D mike. All my interconnect cables are new. Please any help to put me in the right direction would be a great help. Thank in advance. Ps.. i will also get a high pitched tone comming from the R-4C speaker.

George -

It sounds like the LO for the 3rd mixer is not starting reliably. I would start with DeOxit on the MODE switch, which among other things switches between two crystals for either AM or SSB.

It's possible that V4 is weak, but more likely Q4 or the SSB crystal are weak.

There are other possibilities, but I'd start with the switch cleaning and sub for V4 just because it's easy!

Topic: 2397 Message: 2398

Hi Vic -

I'm "sorta" back. Typing is still a chore as my hands and arms are still weak and shake like mad with any effort. They shake just holding them over the keyboard, and they don't always hit the right keys! :-)

I had an aneurysm of the ascending aorta, the main "pipe" coming out of the top of the heart. It was about twice the diameter it should have been, and it seems they have a bad habit of "blowing", which is NOT good! The surgery was a snap, (a Dacron sleeve over the aorta (tire patch) and one bypass while he was in there. But I developed an infection a couple of days later and ended up "out" from June 25 through August 2. I got out of the hospital on August 13 and went to a rehab center until August 31 to try and rebuild a little muscle tone. I'm getting home therapy now, and am making progress.

The rule of thumb is that it takes 3 days of therapy for every day you are "down", so I still have a way to go. We have a hospital bed in the living room, but that should be gone next week. I've graduated to a cane from the walker. My chest looks like I've been attacked by a rabid cat, but the extra holes they punched are healing and the scars are fading.

So... I'm getting there, but it's a long road. When I went into the rehab hospital I was able to walk 12 feet with a walker, with a therapist following with a wheelchair for when I gave out. The day before I left, two and a half weeks later, I walked 450 feet with a walker.

I received a LOT of cards and prayers, and they were gratefully received. I don't know what others believe, but the prayers sure didn't hurt! The QSL cards and emails sure brightened some very long and tiresome days.

Since I have so much time, and backspacing, invested in this message I think I'll copy it to the list. It would be difficult to respond to everyone who wrote, the way I'm (NOT,) typing, but I hope that soon I'll be able to type again and thank each one individually. You can't know what it means unless you've been there!

Date: 2009-09-21 19:56:23 UTC
From: Kris Merschrod
Topic: 2399 Message: 2400

John,

Yes, antennas can be "matched" to the WARC bands with the Drake Tuners BUT - it all depends :>)

I do not know the range of mismatch that can be handled, but my experience has been on dipoles and loops cut for non-WARC bands, e.g., a 15 meter antenna for the 17 meter band.

The approach used is:
1) set the inductor to the next highest frequency band,
2) Set the two capacitors to mid-range;
3) apply some power and tweek the capacitors until a match is found via the SWR bridge.

If that fails, then set the inductor to the next lowest band and do the capacitor tweeking routine.

I have not tried any wild ideas such as the proverbial bedspring.

I got out of the hospital on August 13 and went to a rehab center until August 31 to try and rebuild a little muscle tone. I'm getting home therapy now, and am making progress.

The rule of thumb is that it takes 3 days of therapy for every day you are "down", so I still have a way to go. We have a hospital bed in the living room, but that should be gone next week. I've graduated to a cane from the walker. My chest looks like I've been attacked by a rabid cat, but the extra holes they punched are healing and the scars are fading.

So... I'm getting there, but it's a long road. When I went into the rehab hospital I was able to walk 12 feet with a walker, with a therapist following with a wheelchair for when I gave out. The day before I left, two and a half weeks later, I walked 450 feet with a walker.

I received a LOT of cards and prayers, and they were gratefully received. I don't know what others believe, but the prayers sure didn't hurt! The QSL cards and emails sure brightened some very long and tiresome days.

Since I have so much time, and backspacing, invested in this message I think I'll copy it to the list. It would be difficult to respond to everyone who wrote, the way I'm (NOT,) typing, but I hope that soon I'll be able to type again and thank each one individually. You can't know what it means unless you've been there!

From: Victor
Topic: 594 Message: 2404

Hello all
Bit of a vague question here. Just give you a bit of history first. A couple of years ago I bought an R4C. The seller told me that the guy who he bought it from had told him that it had had some Sherwood mods but he didn't know what mods had been done.
In performance this particular Rx is much different to my other R4C - mainly the selectivity which is much sharper mainly on the pass band control which has a very narrow shut off.
Also, there is a toggle switch on the rear chassis which doesn't really seem to do anything.
Now the vague question. Is there something obvious I can look for which might give me an idea what (if any) Sherwood mod has been done?

If you e-mail Sherwood and send them pics of the inside of the radio, they can help identify their mods if possible. I did that to the Sherwood modified R4C I had and it was a great help identifying the mods I had. Bob Sherwood himself e-mailed me back with the details of my radio after seeing the pics.

Hi Bob and Larry

Thanks for info.

Going to give it a go with Bob Sherwood - Just hope my camera work is good enough for him to take an interest.

I know the Rx is good and I know that somewhere along the line something has stepped it up but I sure would like to find out why. It's a bit like looking at a picture in the dark - you can see the vague outline but not the finer details!!

Cheers

Vic

2411. T-4XB carrier null pot

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-09-24 07:55:21 UTC
From: Richard Knoppow
Topic: 2411 Message: 2411

I have been fighting a carrier null problem for some
time. I discovered tonight that the null pot, R-4, measures
about 450 ohms rather than the 200 ohms indicated in the
schematic. It does not appear to be open. Is it possible
that some transmitters had 450 ohm pots in them?
If this is a bad guy is there a souce for replacements?

Isn't this a standard RCA jack? If it is you can
probably get it working again by squeezing the center
terminal with a pair of pliers. Unless its some really
special part you should be able to get a replacement at
Radio Shack or other parts store although those seem to
mount with a nut rather than a bracket and screws.

2433. Echolink

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-10-01 21:10:22 UTC
From: Dan Galligan
Topic: 2433 Message: 2433

I wouldn't say that Echolink is fantastic, or such, but it does have some good application, in limited scope. I am a cross country truck driver, and it gives me the ability to connect with my buddies in my local repeater group, when I wish to do so. So, for the person who travels frequently, and wishes to remain in contact with folks, some of whom are not capable of HF, all at the same time, it then becomes a useful tool. But, for the member of that local repeater group, who has to put up with the incessant "contacts" by people pretending to be making some sort of DX contact, it is more hassle, than help. I am thankful that my local repeater group has it, but often wonder why they put up with all of the other contacts, just to let me, and a couple of other friends of members, connect.

From: djv5
Topic: 2436 Message: 2436

Hi all,

Need to find a original size mic jack for my T-4XB as someone has replaced it with a standard 1/4 inch one.

Anyone have one from a parts set or can point me in the direction where I can find one?

Also where is the best place these days to buy 6JB6's?

Thanks,
Dave, K8DV

I thought the B series used the aircraft/Collins size
but mine has a 1/4" stereo jack. Makes it much easier to
find plugs since you can get them in any Radio Shack. Mine
appears to be a factory installation.

2445. T-4XB Dial Lamp voltage

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-10-05 02:56:04 UTC
From: jshea_n4dsp
Topic: 2445 Message: 2445

Due to the small type I cannot read my schematic but I believe the #47 dial and S mtr lamps should have 6.3 VAC but I am reading 10.5V on the dial lamp. For some reason the bulb's light output is only putting out about 20% barely making the dial readings visible while the S mtr bulb has full output.
These are in series I believe so what could cause this? I do not have a voltage reading for the S mtr bulb.
Thank You.

john

None of the T-4X series of transmitters came with 1/4" MIC jacks.
However, the 0.210" plugs were always more difficult to locate, even
back then, and as result many were changed 'in the field'.....

The Switchcraft S230 is available from Mouser, which is the right angle
plug for the side mount jack in the B series. The mating jack is a
Switchcraft S12B, also in stock at Mouser.

Found what I was looking for, placed order with Mouser today. I had looked there before but was unable to locate but using the part number that Garey gave I found it with no problems.

It really is not a big deal except all my other Drake gear has the original size jack in them and like to use the same mic with all of them.

Thanks to the group for your help.

From: Garey Barrell
Topic: 2453 Message: 2454

John -

A lot of air is not necessary, just enough to suck the heated air out of the PA cage and blow it away from the area.

I usually put a small fan on the back of the PA cage, which helps the noise as well by directing the noise away!

There are several options. One is to use a small (3" square or so) 12 VDC computer fan. These are plentiful and cheap at hamfests or surplus dealers. Most are nearly silent, but can be quieted even further by applying less than 12 VDC to them. A half-wave diode and small filter cap on the filament voltage of the transmitter works well, and a small resistor can be selected to provide the voltage needed. Many shacks have a small 12 VDC supply to run all the peripheral equipment around these days, and with a resistor are suitable. Also, one of the ubiquitous wall wart supplies could be used.

There are 4 x 4 fans that are quiet. Whisper Fan by Rotron was one that was offered for HiFi systems back when they were full of tubes. The larger fans can be set on top of the cabinet on rubber bumpers, blowing air UP.

Another approach is to find a fan rated for 220 VAC and run it from 125 VAC to slow and quiet it down.

Again, just a little air _blowing OUT_ will reduce the PA temperature considerably.

2456. SPR 4 KNOBS and spr4 Product detecor

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-10-07 04:04:15 UTC
From: w1fued@sbcglobal.net
Topic: 2456 Message: 2456

Does any one know where I could find the knobs for the crystal switch and the preselector tuning for the SPR 4?
I have heard they area available but cannot seems to find them.
The spr 4 I have came with heavy metal knobs (maybe Stainless) they must have been made and sold for the spr as the tuning knob matches the other two, very nice, but would like to go back to the original ones if possible.

Also I have just fitted the spr4 with the SHERWOOD designed product detector. While designed for the r4c, I put one in the spr4 It fits nicely inside. I have marked up drawing for installation if anyone is interested.
Thanks,
Ed

Find an old computer power supply. Most have 12 volt dc fans in them. Then get a wall cube. Maybe one at even reduced voltage from 12 volts to slow the fan some.

As you may already know, there's a vast difference in noise level produced by available 12VDC fans for PCs. For my TR7, I bought a fan from one of the PC sites dedicated to super-quiet PCs and then installed a thermostatically controlled circuit that turns the fan off when the temperature of the air stream (or heat sink in the TR7 case) falls below an adjustable value. Google "super quiet PCs" for sites dealing with PC noise. I built the thermostat controller on a little piece of perf board about 1" x 1.5" that could be mounted on the side of the fan housing in the case of the T4XB.

The TR4 does not use a crystal for the 80m or 20m bands. The operating frequency on those bands is determined by mixing the 5 - 5.5 MHz output from the PTO (VFO) and the 9 MHz IF output.

As far as I know, you're out of luck.

2464. Q Multiplier for R-4B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-10-10 16:13:48 UTC
From: jshea_n4dsp
Topic: 2464 Message: 2464

Anyone using one of these for the drake? I find much loss when narrowing the bandwidth on the B. I remember the heathkits, the ones that look like a lunchbox, and they did a very good job for those rigs we had back then. They would plug into the 455 IF. I do not think the timewave 599zx or other external audio dsp filters would work.

john

Butch -

Any of the 4 Series _separates_ will cover 3.0 to 3.5 MHz (or any other 500 kHz range from 1.5 - 30 MHz) with the simple addition of a crystal for 11.1 MHz above the low end of the coverage, or 14.1 MHz for 3.0 - 3.5.

None of the 3/4 Series _ transceivers_ will cover additional ranges without major retuning or even modification.

The 5/7 Series will cover 1.5 - 30 MHz with only minor modification or with an optional accessory card.

First try bypassing C107 with whatever electrolytic you have more than 40-50 uF. If that doesn't fix it, check voltages on CR15. This voltage must be -0.6VDC under key-up conditions.

If no luck, let us know!

There should be little or no loss in the 500 Hz filter position. I
suspect your Passband tuner needs alignment, or possibly repair. The
alignment is described in the manual, and additional information in the CD.

The Q-Multiplier should work, and will give you even narrower bandwidths
at the peak, but I'm not sure it's worth the effort or modification.

What can one expect to pay for a decent set of twins these days ?

I really could use the extended coverage & I REALLY don't want a modern computer in a cigar box radio. I've been eyeing Ten Tec Paragons for some time. They don't have a great reputation amoung the discriminating & they seem to go for abt $650. I dunno ..... I'm open to suggestions.

Hi,

I Agree that an audio filter , dsp or not, will ever be as good as if filtering, but that being said, I have used a timewave 59+ with great results on all kinds of old rigs, triton 4, argonaut 505, even on the old s20r. The worse the selectivity the better "it works".
I leave the 59+ on my r4b and works very well and enhances the signal and gets rid of all kinds of crud on cw. Even the noise reduction works a good bit. The effect of the 59+ on the r4c with the narrower filters,is very little.
I picked up the 59 + cheap and find it very effective, but recently found a couple of old heath q multipliers for 10 bux a piece, put one on the s-20r another on the 2a and the results were dramatic, you could almost use the s-20r for a cw contact on 80 or 40. I also have one on the 2b.
All that being said, as others have pointd out, sounds like you have a signal loss somewhere on the Drake 4.

That's an interesting tidbit. Earlier this year I latched onto a ClearSpeech Base, and connected it to my TR7. It is nothing short of amazing with static on 75 meter fone, but I notice that the noise reduction works better quite often with wider IF bandwidths. It gets even more interesting when I run a QF-1A ahead of it. It seems the thing needs more noise to remove noise better.

Garey -
Turns out my keyer took a hit on the grid block keying out put,
I found out when I got out my 2-NT to hook up. I was getting ready to replace C107 (I have one from Hayseed but haven't put it in yet)
When I thought would check the ol T-4XC one more time with just a straight key plugged in.
I'm embarresed it was the keyer and I didn't think to check it hi hi.
Thanks for the tip es 73

Hi

Were you by any chance trying to key it with the positive keying outlet from the keyer and not the grid block? With the positive keying outlet you get continual key down on the T-4XC. I know, I've done it and spent ages wondering what the hell was wrong when all it needed was shifting the phono jack to grid block.

One of the problems these days is that modern keyers only cater for solid state and don't have a grid block outlet.

Cheers

Vic

From: Dave
Topic: 2462 Message: 2479

Hi Vic -
No the keyer had taken a spike of some sort and was shorted and I didn't know it. It is always hooked to the T-4XC on the grid block output. But like a dummy I didn't think to disconnect it.

2480. My new TR-4

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-10-13 02:13:47 UTC
From: Cameraman
Topic: 2480 Message: 2480

Went & picked up the TR-4 today. Even got the original instruction book (gud thing !)It was pretty dirty but I cleaned it up & got it on the air. Everything seems OK except the mic. I get bad reports some times & OK reports sometimes but I'm told it's "scratchy". The mic is a G.E. w/ a Shure element in it. Seems like some kinda switch trouble but I've had it apart repeatedly & at best it's intermittent.

Is there a consensus on a gud mic for old Drakes or is it a matter of taste & availability.

b

PS. I love the little plug, never saw one of those hanging on a peg at radio shack !

Do you have anything else to test the mic with? Be sure
that's what it is before searching around for a new one.

Might be a bad cord, too.

Good mics that I have tried on various Drake with good reports: Shure 444, Turner 254HC, D-104 (non-amplified, add 470K resistor), EV 729, Turner +3 (yeah, I know...).

Best audio reports with my voice seem to be the two Turners, the EV, and the D-104. YMMV. The Shure 44 has a more natural sound that is well suited for casual rag chewing.

Topic: 2480 Message: 2484

Well, I KNEW it was gonna come down to a D 104 or a Shure 444 'cause I don't have either one laying around at the moment.

I wish I had an adapter to put my TT 705 on it, it's a known good mike. The guy I bought the radio had 3 D 104s sitting on a shelf in his shack.......silly me !

Folks want $20 for the plug on ebay, Holy Scmoly, this vintage radio stuff is pretty pricy, maybe 'cause they fit a Collins too. Hi Hi

By now I've now established 2 seperate ham shacks in the house, one upstairs (transistorized) & one in the bomb shelter (tubes). Everything works off the same ant farm & by now there r so many switches, connectors, tuners & meters that I'm working up a sweat on the stairs. At first the Drake didn't seem to have ANY receive at all. I finally realized it was plugged straight into the back of a 520S. Oops ! Glad I didn't try & tune it up.....

A work in progress.
Tnx,
Butch KA4MIC

The gurus on the Drakelist reflector know where to get plugs. I think one or two of them hang out here as well. Information may be forthcoming. If nothing else turns up, I've got a bunch of PJ-068 plugs (the military variant) with cords attached, I could dig one out. They aren't right-angle, though.

Go back and grab one of those D-104s.

Is this the same plug as used on the T-4, if so there
was considerable discussion on this list a few days ago. One
poster said that Mouser stocks both plugs and jacks. Much
less than $20.

I've also heard that Mouser has the plugs altho I'm not familiar w/ them. I just think that this illustrates that ebay is often NOT the place to buy stuff. Some folks get caught up in the bidding war & others depend on the fact that not everyone has a gud idea of the actual value of items.

I believe I've located a plug or 2. I hope to get this radio on the air soon, it's not mint but it sounds excellant on receive & in between scratches & pops I get an occasional gud report.

The speaker cabinet is interesting.....looks like someone shot a .45 thru the front of it. Actually I guess it has had a plug or mod of some kind but the bullet thing sounds gud. Maybe I can get one of those bullet hole decals & stick on it. Did John Wayne ever use a Drake in any of his war films ????? VERY COOL !

Mouser is a large parts house with a very good
reputation and no minimum order. http://www.mouser.com
I did a little searching and found their stock number
502-S230 which appears to be the right part. This is a
Switchcraft right-angle RTS plug of 0.206 diameter, $11.37
each in single quantity.

Nice hearing some of u on the drake net last nite. I cleaned & resoldered my mic for 2 hrs today & it's still CRAP !

Anyone have a decent mic for a tr4 at some reasonable price. I'm pretty frustrared & am considering selling the radio for lack of a mic.....this is supposed to be FUN !

b

PS. I had the tr4 set up right beside my Omni V so I could switch back & forth between the 2 last nite. The drake has excellant audio, as gud or better than the Ten Tec but of course w/ the TT u have better filtration, notch & passband tuning etc & under bad conditions it does better. I'd think on 20 or at a time when the qrm/qrn was minimal the tr4 should really shine.

Here's another issue. I MAY have gotten the mic squared away but now the rig seems to key itself periodically. I can get it to drop back into the receive mode by quickly keying the mic & letting go.

It does not seem to be a vox issue, vox is set fully ccw & anti vox full cw. It MAY go into tx with or with out the mic plugged in but I'm not absolutely sure yet. I definitely does it w/ the mic plugged in. On one occasion it unkeyed when I turned the xmtr gain to zero, a coincidence maybe.

Acts to me like a sticking relay or maybe still the mic but I dunno.

What chew think ??????????????????//

I purchased a box of 120cm fans on Amazon.com. They are mounted atop my TR-4C. They are so quiet, one would not know they were there is they were not visible. I will send you a link to the product tomorrow morning. If you have already found a solution that suits you, at least you will have a reference for future needs.

Here's a question for u. This tr4 has a switch installed in the extreme lower left corner of the front panal. I'm thinking this would be where the noise blanker control would be if it had one. When I first got the radio turning this knob cw would shut off the speaker but now it seems to do nothing. In the cw position I still hear the speaker. If it is a noise blanker that has just started working it seems innefective but then maybe I'm not giving it an ignition type noise to work on.

Any ideas ?

Tnx,
Butch KA4MIC

John -

Just about all the alignment of the 4 Series can be done with nothing other than the calibrator as a "signal generator".

The only place I can think of offhand is the alignment of the filter matching, (those wires wrapped around IF transformer pins!,) that really shouldn't be messed with unless you have reason to believe they have been "fixed" by a previous owner.

That said, I don't think the RF-1 would be stable enough, nor adjustable _accurately_ enough, to be of much help. Probably the only Heath generator that would be good enough would be the IG-42, which is a pretty stable and finely adjustable generator. It also is well shielded to prevent alternative or leaky paths to confuse the issue. And even the IG-42 would require a counter to be accurate enough to be of any help.

IF the receiver has been "fixed" previously, then a generator might be useful to get badly misaligned stages back where they belong, but if you are hearing the calibrator, a "field" alignment with the calibrator will be more than sufficient!

Thanks Garey. I don't think the filter matching was touched. I merely want to tweak things. Before I do that though I thought I would purchase a full complement of new tubes and use the present ones as backups. I found one site called hamtubes.com but you may know of others that you can pass along.

I bought a set of tubes for an hw101 from this Joe at a very reasonable price. I've lost his fone # but here's his email.

John -

I would suggest that you keep the original tubes, and use your new set as backups. Very few tubes "go bad" in use, absent symptoms. I have seen RF Amp tubes (6BZ6) get weak, IF Amp tubes (12BA6) get "gassy" upsetting the AVC and S-Meter operation, and AF Output tubes (6EH5) get gassy causing the cathode voltage to rise and an increase in distortion. The C-Line has the 6EJ7's which are sometimes difficult to replace since many are noisy out of the "NOS" box.

From a practical standpoint, if the receiver can be aligned according to the procedure in the manual, AND the background noise goes up when you connect the antenna, you're there!

I suggest you get one of the Elecraft XG-1/2, or NORCAL S9 signal generators. These are inexpensive, and provide a _calibrated_ signal of either 1 uV or 50 uV on one or more bands. So all you have to do is first FIND the generator on the bench, since it's not much bigger than a computer "thumb" drive, and connect it to the receiver antenna. The 1 uV signal should be about S2, and the 50 uV signal should be S9. If this is OK, you are done!

There are several reliable tube sellers.

Antique Electronic Supply <www.tubesandmore.com>

ESRC <www.esrcvacuumtubes.com/>

RadioDaze <www.radiodaze.com>

Vacuum Tube Inc <vacuumtubesinc.com>

Electron Tube Ent <http://members.aol.com/etetubes/>

Radio Tube Supply <www.radiotubesupply.com>

Prices vary, and I would suggest specifying Sylvania, RCA or GE branded tubes if possible.

2507. R-4B mods

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-10-20 18:49:32 UTC
From: JC
Topic: 2507 Message: 2507

I am eagerly awaiting a R-4B.
With respect to mods, I know there are two (maybe more) philosophies. Do NOT mod a Drake. Mod it and make it better (aka Sherwood and the R-4C).

In looking around the internet I came across an article by Giorgio IN3IEX (http://www.ing.unitn.it/~fontana/R4bmod.pdf). These mods look straight forward. But are they useful?

Anyway, has anybody done these mods? what do you think?

73/Crit/K4BXN

Crit -

First a disclaimer..... I am a confirmed Luddite when it comes to vintage gear. I prefer to use them as designed, warts and all.

That said, I have seen the mods by IN3IEX, and I can only say that the "distributed gain" of any receiver is critical to optimizing performance with regard to sensitivity and resistance to overload. I think Drake engineers, by the time the R-4B was done, had pretty well worked the best compromises out and went with them. Again, if the noise level increases when you connect an antenna, and peak the preselector, more gain serves no purpose and only DECREASES the overload distortion capability of the receiver.

As I said in an earlier message, the only real test of the NB is to connect a wire to the antenna lead and drag the other end across a file grounded to the receiver chassis or even just across an uninsulated area of the chassis or shield. When this is done, set AVC to FAST and see that with the NB OFF, the spikes generated will peak up to S9 or higher. Turning the NB ON should drop the meter reading considerably. If it doesn't, there may be a problem in the NB circuit. A properly "adjusted" NB will blank the noise pulses created in this way, yet will cause little or no distortion of very strong signals.

These mods are relatively minor, so probably won't make the receiver much less capable, but I also doubt they would make a discernible difference in the effective operation either.

Just my opinion ...

I think this is probably valid for a "dummy" antenna
with only thermal agitation noise but real antennas pick up
a lot of atmospheric and man-made noise. One could well
design a receiver to take this into account. I think it was
done for a number of all wave receivers that covered the
broadcast band. i.e. either the gain of the input stage was
reduced in some way or it cut out for this band. An example
is the TMC GPR-90 which has a very quiet grounded grid input
which is by-passed for broadcast band use.
I agree completely about too much gain in the front end
(or anywhere). Many years ago receivers were speced based
on the amount of audio they would put out for a given RF
input. Had nothing to do with noise level and was a pretty
much useless spec for other than trouble shooting. There
were also a number of pre-selectors available. These were
supposed to increase "sensitivity" but probably mostly
increased overload problems. They probably did improve image
rejection. I think RME was the best known brand.

Richard -

Quite correct. On the other hand, if ONLY the atmospheric noise causes the meter to rise, you have still determined the maximum "useful" gain for that location at that time. :-)

Unfortunately, in most areas these days any HF receiver is limited by man-made noise!

Yes, many added pre-amps to their receivers and were very happy with the GREATLY increased S-meter readings. That is until they noticed that the noise level had increased a like amount!!

I don't think we disagree about anything. Assuming the
noise figuure is measured with a resistive noise source
equivalent to the antenna the noise should be the same for
both, again assuming no outside signal. The open circuit
```

noise may be different so connecting a resistor or shielded antenna to the input might acually result in lower output. I am not sure when hams became sophisticated enough to understand that gain and internal noise of first RF stages might not be as important as low distortion and the ability to pass weak signals in the presence of stronger ones.

Hank -

The T-4XB takes roughly 80 to 120 mA at 250 VDC.

It should regulate within 10% over the range, and have less than 0.25%
ripple.

That sounds like you may have a dangerous AC line leakage problem. You need to carefully check your power supply for the problem. Also, if you have not done so recently, make sure your radio room's AC power wiring is correct, with one of those plug-in AC line testers.

Sounds to me that you have an open or non-existent ground....all your radios/power supplies, need to be grounded to a good **outside** ground...preferably an 8 to 10' copper (coated) ground rod and then a good 1" (Depending on far you are from your ground) braided copper ground strap to grounding bar by your electronic equipment and then from the grounding bar to each of your electronic devices. It is also **extremely** important to make sure your grounding strap is not cut to a frequency length!!! (Hopefully I haven't left anything out..if so, lease add to what I said...Butch has a very dangerous situation in his shack!

Be very careful until you get your grounds in place...electrical shocks can be hazardous to your health!

Well
Not to get into too much math all I can tell you is that the loop I did
have checked around 100 ohms at 40 feet. I feed it with a matching
section of 75 ohm and worked fine .I wound a 2:1 balun and it worked
fine ,but it also worked with a 4:1 balun so whats the big deal .It
works fine either way

Topic: 2514 Message: 2520

The real question is:is a small leakage to the chassis normal on this unit normal-on some older gear, this is normal, but if not, then the reason should be determined.
Also, "a little bite" may still be enough to be dangerous under the right conditions-the main question is:how much current is flowing between the chassis and ground?
Another point:I suspect it won't matter on that unit, but you might want to try reversing the AC line plug.
As for the hum, if grounding the unit does not affect it, then yes probably filter caps, or a lousy rectifier, or a heater to cathode short in a tube.
The filter caps, good or bad, should not affect the leakage to the case, except perhaps if the cap is in a metal can, and grounded to the chassis-under those circumstances, then if the cap has a fault allowing current to flow between the actual cap, to the can, then maybe(rather a long shot).

Topic: 2514 Message: 2522

Electrolytics go bad. They were never intended to be used for 40 or 50 years. Why is it so difficult to understand this? There are electrolytics in the AC-4 and also a multi-section can in the radio or transmitter or transceiver. These caps are failing every day as someone announces his just failed. There are also companies that have made new exact replacement caps and conversion kits available to replace the old ones. (The Heathkit Shop and Hayseed Electronics).

Bad electrolytics cause hum and can also ruin your final tubes and do wierd things to the performance of the radio.

I would think time would be better spent renewing the rig with fresh parts then spending hour after hour talking about should I do this or that. It is obvious from past lessons, change the damn things out! Why would anyone want to "bring up old caps slowly ", hunt for a variac or try and insert light bulbs in a rig when you know the electrolytics are past their life expectancy and new replacement parts are readably available at fair prices and others with the same radios are experiencing electrolytic failures all the time? Yes you can play Russian Ruellette and push the old parts. Some will be lucky and have no problem but this won't be true for everyone. Replacements are inexpensive and easily obtained. You need to take charge, the government isn't going to do it for you!

Oh Lee....U've dashed my hopes ! Actually I had the radio in the shack for several days playing w/ it then other pieces of candy caught my eye & I carried it to shack #2 in the basement. I've done nothing to it since. I now also have a Ten Tec 12v supply that has hum & I've changed it out for another PS so I have 2 to get in shape. This is a preliminary inquiry. I'll be in touch.
Tnx,
b

I know you put it away, but here is something to think about if you ever get
it out again and play with it. At the advice of either this group or the
Heathkit group. I took out the old AC line on my AC-4. It was nothing more
than 2 conductor lamp cord. I replaced it by taking a PC power cord and
cutting off the end that goes into the PC. Make sure the green cord goes to
chassis ground. The White wire went to the terminal that had the two tone
conductor, and the black wire went to the other terminal. Fortunately I have
not had any problems so far with the AC-4.
I too believe that you need to check out the electrolytics.

2529. Artifacts using Drake R-4B AGC

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-10-24 17:54:15 UTC
From: jshea_n4dsp
Topic: 2529 Message: 2529

Using cw 95% of my operating time causes me to turn my agc off on the R-4B. This is due to the artifacts generated in the slow agc position by the detector. Fast agc is useless.

This receiver is stock and no way I am going to put mods into it. Bob Sherwood does have a mod which corrects this condition.

Would a SCAF filter "clean" this up? Surely there are others who have experienced this and sought out some improvement.

On another note I have been looking for a moderate expense headphone without the boom mike. I have been through the Sony's and others which are being sold at Radio Shack, Target, and Best Buy. I do not want to pay $100.00 for a Heil and not a subscriber to these noise canceling gimmick headsets. Most of all is comfort. Everything I have tried within ten minutes my ears feel like they have been in a c clamp.
Is there anything out there for comfort and around 50 dollars?

Thank You

john

Hi John-
As a ham for 45 years I've accumulated many, and I mean many, pair
of headphones. Some have been more comfortable than others but, in
the long run, I haven't found the "ultimate". I keep falling back on
just a good pair of walkman earphones with a 1/8" stereo to 1/4"
mono plug. They are really comfortable because they have no weight to speak of. The ones I favor are Sony, Magnavox, and Koss in that order.
Not only are they cheap but the frequency response is just fine for either voice or CW. Also, the replacement foam pads are readily available from Radio Shack. The only con I can think of is since they don't completely cover the ear, you still can hear outside noise (the XYL, etc.) HI!

Crit -

If the S-meter reads S1 "0" with the Preselector detuned and the RF gain full CW, and full scale with RF Gain full CCW a 50 uV signal should read S9 with RF Gain full CW.

2536. Drift on Receive?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-10-30 18:50:03 UTC
From: jshea_n4dsp
Topic: 2536 Message: 2536

Away for five days and turned on the B line and quite noticeable listening to a ssb station. The signal will suddenly start to drift in freq. I am listening on 20 mtrs. At first I thought it was that particular station but such is not the case. When I switch the Transceive Control from RCVR to XMTR it does not occur.

Someone point me in the right direction to troubleshoot this?

Thank You.

john

2537. TR4 for sale

From: wilderness4two
Topic: 2537 Message: 2537

I have a nice Drake TR4 for sale. Includes radio, power supply/speaker, hand mic, original manual & abt 10 spare tubes. Radio is in nice shape, has excellant audio & I get gud reports w/ it. 150+ watts out. Speaker front has been modified w/ some extra holes & a jack. PS has a hum but works fine. I believe it has the noise blanker, at least the switch is there.

I'd be happy to work a sked so u could hear it on the air.

$250. I'm in S.E. Ky. would prefer not to ship but .....

About an hour later the R-4B no longer drifted. I am suspecting a capacitor. Since the receiver was not used for 5 days and then being on for an hour it could be a leaking cap and now it is fully charged the drift has ceased.

Anyone have opinions on this?

I don't think its a cap. Possibly some moisture got
into it somehow and has taken a few hours of running to
evaporate.

2548. Unknown Crystals for R-4B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-05 23:24:16 UTC
From: JC
Topic: 2548 Message: 2548

I picked up a nice R-4B and enjoy using it ... use it to RX and my TR7 to xmit ... sounds sweet.

Anyway it has some crystal plugged into the back ... only one can I figure out. That one is marked 28.100 ... thus is for 17.0-17.5 Mhz.

But the others baffle me.
5.645 (says R-4B on it)
1820 (says R-4B on it)
150 155 (says R-4B on it)
7895 (says G16 ?Tedlord???)

What have I got here?

2550. RE: [DrakeRadio] drake equip

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-06 01:09:22 UTC
From: barry whittemore
Topic: 2544 Message: 2550

I assume you mean RCA plug. I did find one of them about 1.5 ft long with a lug on the shield.

2552. TR7 17 meter display oscillation & IF gain question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-06 12:51:24 UTC
From: David
Topic: 2552 Message: 2552

Hi all,
A two part question for a TR7:
1) Have an aux7 installed, and on 17m I sometimes get oscillation or erradic behavior of the frequency display on transmit. It would seem that somehow RF is getting back into the display board and causing this symptom. Any comments? Seems to be isolated only to the diplay board. Actual TR signal and fequency is unaffected.

2) Is it common to have the the IF gain on the 2nd if audio board set at maximum? Or should it be backed off some during alignment? I've heard that every TR7 serviced at Drake came back this way? True?

Thanks,
David

2553. Hello from East Africa

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-07 05:37:58 UTC
From: np2or
Topic: 2553 Message: 2553

I have been a member of this group for several months but this is my first introduction post. I am Jack Dunigan, NP2OR, licensed in February of this year when I was living and working on St. Croix in the US Virgin Islands. I am a fan of vintage gear and own 2 Drake TR-3's along with 3 AC-4 power supplies, one of which I rebuilt with modern components from the guy who sells the upgrade kit (sorry, can't remember his name.)

Before leaving for Uganda, East Africa, we bought a home in North Ft. Myers, Florida which is where my Drake gear presently resides. I am the interim Director of Aidchild (www.aidchild.org) here in Uganda and have applied for an amateur license. Because Drake radios and their power supplies are so heavy I was forced to bring a modern Icom with me (my apologies to the group) so I could meet the luggage weight restrictions imposed by the airline.

I read this groups posts regularly and appreciate all the great advice and encouragement. Even though I will be using modern gear here, I am anxious to get back to Florida and fire up the TR-3. For anyone interested I am blogging my amateur radio activites here in Africa at www.hamradiosafari.com.

2554. info on digi-brain

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-10 13:16:59 UTC
From: barry whittemore
Topic: 2554 Message: 2554

Does anyone have information on the digi-brain?
I have a black box with three switched and an LCD display on the front and a 5 pin din , RCA and 1/8 phone jack on the back.
I have powered it up. (1/8 inch phone) and i get what appears to be an offset freq.
The output according to my freq counter is about 6 MHz
I would like to find info on this unit.
I have gone to WA0VNEs website but there is no downloadable manuals and i have gotten no response to an email about it.
None of the switches or connectors are labled and other then the power connector and power switch none are obvious.
any one have a manual scanned?
Thanks
Barry

Digibrain was in May 1996 QST. QST has the binary of it at
http://www.arrl.org/files/qst-binaries/
and http://www.arrl.org/files/qst-binaries/dbrain.zip
but the file looks like it is just the source code to program the 68HC705 (if memory serves me) cpu.

If you have access to back issues of QST you should be able to find the article there.

I have that board as well as the earlier Digivfo of Craswell's that apeared in the May 1995 issue of QST but never used them. There was no manual.

Good luck.

Jim Pruitt

2561. R2 Resistor Cooked in TR-4Cw

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-13 19:48:55 UTC
From: Noodle10536
Topic: 2561 Message: 2561

I had my TR-4Cw sitting on my shack bench just receiving, no TX, and suddenly it shorted internally. I shut it down as quickly as I could. Upon inspection, the R2 resistor is cooked. Does anyone have any ideas what the most probable cause is for this particular short? Thanks, Peter.

2562. Re: [DrakeRadio] R2 Resistor Cooked in TR-4Cw

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-13 21:22:10 UTC
From: Garey Barrell
Topic: 2561 Message: 2562

Peter -

If it's really R2, 1.5k @ 1/2W connected to the same terminal as the 750 ohm, 5W resistor, it may just be an internal short in V1. It could also be a short in T1,T2 or T3. Possibly a shorted C8. Of course it could also be a physical short in the wiring associated with the above.

R2 only feeds stage V1, so it's in that area, which naturally is a LOVELY area to troubleshoot! :-)

You might take the 20 crystal out and put it in one of the A-B-C slots to see if it works in where one of the optional crystals might go. If it works there, you probably have a bad contact in the crystal socket. Just a thought.

DRake 2B deaf on 40 meters. No peak of noise. Some on 20 80 meters is quite good.

ANy ideas?

From: Ken Simpson, W8EK
Topic: 2566 Message: 2566

Drake items for sale:

Drake TV-3300-LP Low Pass Filter
This is a modern low pass filter to go between your transmitter
and antenna, and has been optimized to have more attenuation
in the 40 MHz region, where many TVs have their IF. It is good
for 1000 Watts "average" according to the manual, and has
over 80 db attenuation at 41 MHz. This one looks great, and
includes the paper work. $30

Case for Drake TR-33 C
This is the black case that fits the Drake TR-33 C, and has
cutouts in the back for antenna, power, etc. It includes
the shoulder strap, and is in good shape. $12

Case for Drake TR-22
As above, but for the TR-22. No shoulder strap. $10

"Unobtanium" 3 pin mic plug
This is the small 3 pin mic plug that fits the Drake TR-22
mic jack. It is much smaller than most of the mic connectors.
I thought these were completely gone, but one appeared from
a silent key. This one has been used, but should still be
usable some more. $12

Prices do not include shipping from Florida.

Thanks.

73,

Ken, W8EK

All group memebers are welcome to post here on this message board, so for those that have questions please don't be shy and for those that have answers, please feel free to give advice to others (what you put into this group you will get back so participate if you have a chance). Although we would like to focus on Drake Radio subject matter any Ham Radio subject matter is allowed. This includes any QST's of events or hamfests, especially if Drake radios are included

For those of you that have not introduced yourself we welcome you to do so and please feel free to upload your station pictures to the photos section of our groups home page, as well as links to Drake information or your homepage.
Thanks to all members for your particapation.

Hello Everyone,

I am considering the purchase of a Drake TR-4, VFO and Amp/PS.

I do not have a radio other than a tri-band HT which I purchased this year. The ham radio bug hit when I was looking into marine radio for our sailboat. Since that time I have become an amateur radio operator with a General license. I find myself now studying for Element 4. I also listen to an ARRL tape on morse code on the ride to-from work in order to learn CW. I do not belong to a club and so my exposure to equipment is zero.

What is it about your Drake equipment/experience that you can tell me which will convince me that Drake is the way to go?

why do I like Drakes? Because they are a FUN old rig to play with. The fun factor of the old rigs is better than the new rigs because you have to tune and load rather than turn on and talk. Plus the receiver audio on a Drake is wonderful.

.
.
.
I have "cherry picked" a pair of RL Drake HF antenna tuner MN-2700 that I have been holding in my personal collection for intended future personal use. However, lifes priorities have encouraged me to offer them now.

They are in near new condition with original owners manuals.
The prices are $395 firm. If interested, add $80 for the like new B-1000 baluns.
Buyer picks up in Orange county, California or pays double boxed Fedex ship (appx $24).

Overseas ship possible, inquire for ship rate.

I do NOT read this board everyday so if interested, please respond to:

The TR-4 can perform very well if properly set up and aligned. They may not be as easy to use as modern day products (need to be tuned) but a good performer and the audio is very easy to listen to. There are several filters and a NB option that you may want to consider depending on how you will be using the rig (SSB CW etc) that will/may influence the price of the rig. For their age a clean well adjusted Drake receiver can outperform or at least keep up wth many of todays midrange/highend receivers. Drakes are relatively easy to work on however some parts are becoming hard to find. In 20 yrs of owning Drakes I have never had a Drake fail/die completely, relays may need cleaning, PS caps or finals replaced, pretty minor stuff. My 7800 has been in the shop twice in three years, no way Im going to work on that. Drakes other products (R series receivers for instance) are still very competitve and can be aligned and modified to
keep up with higher end receivers on the market today. In general the Drakes provide a very good value for their performance providing you dont over pay for the unit initially. There are few "blue book" sites that can help with the pricing. Stock Drake equipment may not initallly support the WARC / 160Ms but with the addition of a xtal(s) those issues can be resolved. Interfacing to a Drake (for contesting etc) may present a challenge but for rag chewing/DXing they are hard to beat. So there ya go, thats why I like 'em.

K7MS and the Group,

This is the type of information I was hoping for. Please continue. I like the idea of tune & load and I have heard of "glow in the dark" plus nostalgia as long as the equipment is set up and aligned properly per K7MS. I take it that the positives are great audio receive, ease of use and some short comings are limited/non NB and limited ability to split. K7MS, thanks for the info on how some parts are becoming harder to find. I aspire to the lighter side of amateur radio with not so much contesting, so the rag chew, DXing may be up my alley!

K7MS, KJ5QAH and the Group, 73s

Jim

Hi Jim,

I have been using the old tube type radios since first licensed in '56. I have only owned one solid state radio in my life, and that was an Icom IC-735 that I bought just for mobile work. At the time I was driving big trucks.

Now, all I own are Drake pieces of equipment. I have a set of twins, TR-4, TR-4C/RV-4C, L-4B amp and various other pieces. I will never own anything else. They are easy to work on should the need arise. The have great audio, both transmit and receive. There are times I can make contacts with stations that others can't even hear on my nightly frequency. All of mine have had the blue LED's installed and they look great. Follow the link below and look at my Drake station if you like.

Hope this helps you make the right decision on buying Drake gear.

Hi Jim KJ4QAH,

I own a TR-4/MS-4, and keep it on a shelf in my storage locker, wrapped in plastic. When I have time/money, I'm going to refurbish it (have already done the MS-4 update). I keep it because I have a bad feeling about Solar activity. We've had such a long period of dead solar activity, I have a hunch that things will return with a huge bang, and contain sufficient EM-energy to blow out everything from satellites to solid-state equipment on the ground. In some areas of the U.S. this will include power-management switching equipment. In others, everything from TV's, Cell-phones, and microcomputers will be damaged.
This kind of backlash occurred twice already in U.S. history, once in 1857, and again in 1958. But we were lucky (sort of <grin>) in that solid-state electronics was not in large-scale use in either one of these previous events. And the more manufacturers use circuits that use smaller and smaller internal voltages (tinier circuits require this to create smaller circuit channels) the easier an EM-event that damages circuits can occur.

So I am keeping one tube radio in reserve, as it uses circuits that have such high basic internal voltages, that it is unlikely to be sensitive to EM-surges from rampant Solar events.

But to answer you question, a working TR-4 is a good radio. It's more work to operate than one of the more modern rigs, but because of its' tubes circuits, and point-to-point wiring, a person with a schematic can often fix it himself with nothing more complicated than a soldering iron and some prayer <grin>. Even alignment is fairly straight-forward, but you have take precautions (because of the high internal voltages for safety) that a modern radio often doesn't even need.
A tube radio is also quite handy as an auxiliary room heater in your Winter shack <grin>. Especially when you are having an all-nighter on 75-m.

Good luck and have fun!

My first rig in 1977 when I got my license that was offered to me was a Drake 4B Line, the T4XB, R4B. I then acquired through the next couple of years the C4 console and the MN 2000 tuner. There were great times had chasing DX on that equipment. The receiver had great audio and pretty good selectivity, sensitivity and the transmitter was great also. I still have them and will keep them as well. I still like to use them every once in a while.

From: K4GM-George
Topic: 2577 Message: 2577

I have two L4-B amps and have decided to sell one. The big problem: which do I keep and which do I sell. Both are in good electrical condition. Both put out about the same power. One has an outboard fan mounted on top. The other is in virtual mint condition. Is it worth comparing drive levels for a given output? Would that indicate whether one set of tubes might be better than the other or could that vary a lot without being significant? Any other thoughts about judging the better of the two?? All replies greatly appreciated.

Topic: 2561 Message: 2579

Garey, It is definitely the R2 resistor. It is cooked but good. After the audible short & smoke rising from the area you could smell and see the source. It all fell apart when I touched it lightly. I have put out feelers for some good used tuning coils. You are correct, that area of the radio is a real joy to access especially for a hacker. Even replacing the coils will be a bit of a challenge. Hopefully I can get it fixed and on the air. This one has the AM filter modification written about with the Inrad filter etc. Well I have the new resistors and when I get the coil(s) I will dive in. I tried pretty hard to find wiring shorts or other problems that would be readily identified visually, but no such luck. Could it be the coil can or cover causing the short? Thanks for your help. 73's, Peter KC2RBX

2580. Noise Blanker Effectiveness

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-17 23:33:26 UTC
From: Richard Knoppow
Topic: 2580 Message: 2580

There was some discussion in the past about how
effective the noise blanker was in Drake receivers. I have
an R-4B, while I don't have ignition noise here I noticed
that some high-level impulsive noises, caused by switching
stuff on and off, for instance, could desensitize the
receiver for a brief time. The noise caused the AVC to
opeate and the long time constant caused a noticable "hole".
The noise blanker competely prevents this. While it has no
effect on the sort of constant rasping power line noise
which is so common it does indeed work very well on
impulsive noise which would otherwise desensitize the
receiver.

2583. My New Drake 2B

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-18 14:10:59 UTC
From: Lee Buller
Topic: 2583 Message: 2583

Gents....

I have never owned a piece of Drake gear in my life, but I now own a Drake 2B. I was looking for a vintage receiver that was all tubes. I guess I had the BA scratch. Well, I picked up a HQ-110 at Dayton this year. I like the RX, but I felt there was something out there better.

I started looking and readying about every article there was on receivers frorm about 1955 to 1969. I landed on the Drake 2B. Well, along comes one on Ebay that seems to be ignored my everyone and I got it for a good price....at least I think I did. Came with a 2AQ too and that works too. I recently picked up the calibrator too which was on EBay. I paid way to much, but now I have it.

The 2B works on 80 and 20...but dead on 40. Asking questions, most people indicated a dead crystal on 40. I ordered one from ICM. It also seems dead on 15, but I will worry about that later.

I took the RX out of the case and looked at the guts! WoW! Impressive construction. I mean that is impressive. Now, I was a Heath person all my ham radio formative years because that is all I knew about out here in Lower Dump Truck Kansas at the age of 15.. So, I am really impressed with the design, quality, and care of construction.

I looked inside the box because there are two "jacks" on the back side that are not stock. Looks like someone put the audio out to a 1/4 inch jack and a 1/8 inch jack for some reason. I am going to remove those.

So, I am worried about the lack of RX on 40, but hopefully the crystal will take care of it. I too the crystal out and put it in "A" slot and it did now work there either. So, I am pretty sure it is bad. But, I am really impressed how it works on CW and SSB...filtering and the pass tuning is impressive...comparing to the rigs I have owned in the past.

The chasis is somewhat dirty, dusty and "stained", but I will be going over it with some Q-Tips and 409 cleaner.

So, that is the story....I am somewhat hooked on this little receiver.
I hope I can get it going again on 40 and 15. I am going to team it
together with and old Knight T-50 and its companion VFO. Fun!

By the way, anyone know where you can get one of those gray clips for the bottom of the receiver where the cabinet screws together? I am missing one.

2584. Re: T1 and T2 tuning coils wanted

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-18 14:57:27 UTC
From: Noodle10536
Topic: 2561 Message: 2584

Garey, Well....with the help of a buddy who is a repair technician who is also familiar with the problem with my particular radio, we have narrowed it to one of the two coils. It is an intermittent short and if you wiggle and straighten the aluminum covers on these two coils it stops for a long time. They seem to settle back to a skewed position and then after months of use the short presents itself again. I am leaning toward it being T1. I plan to take them out one at a time and replace what is necessary, but I do not want to leave it apart while I am searching for the coils for fear that I will forget how to re-assemble it. So it was my idea to have both on hand to change them out all at once. I will be doing the repairs and replacement myself and I am certainly not an expert on the circuitry. I am a competent parts changer but not a complex circuitry troubleshooter. I have emailed about 6 people from the internet Drake pages and come up empty. If you may know of a source, please let me know. Thanks for your help, Peter KC2RBX

Have had my license just short of ten years. Got my General in my first year. Originally just wanted to get on the air - HF - and communicate throughout the Western state regions, particularly to a net my dad, ka7swi, is on. Great folks...would visit them in Yuma in the winter, especially for the SuperBowl. Most of those are SK now. The more I learned, the more I wanted to learn: first procedure, then mechanics and now electronics. But learning on newer rigs was way ahead of my game.

Had a Drake MN-4C tuner given to me (thanks Uncle Frank, wb6yjq) that was jury rigged but working and realized from researching the web how well these things were made and how much I could learn from them ...thanks to groups like this and their experienced hams... just as importantly, parts can still be found. Started collecting rigs and understanding how the different lines developed. Got hooked. Education is an addicting drug. Guess I am a little more nerdy that my past would indicate. =)

I also tend to be one of those guys that can't leave well enough alone. Everything I own usually gets tinkered with and "improved". One thing I learned from our elmers here is when to leave things alone; use it the way it was designed. ...not that there are not some times where improvements might be needed. Wisdom!

Still learning. Thanks guys, I jot down just about everything I can, ready to use it or not.

God bless
73

2586. Re: [DrakeRadio] Re: T1 and T2 tuning coils wanted

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-18 20:36:18 UTC
From: Garey Barrell
Topic: 2561 Message: 2586

Peter -

Bill's got the right idea (surprise!) :-)

I don't think I've ever had to replace a T1, but I would bet that the fault is repairable. UNLESS the short to the can occurred on the "downstream" end of the coil! I've run into a couple of coils that developed a short like that, and even though the 1.5k resistor sacrificed itself, the coil wire was charred and the "coil" had become a lump of copper.

I could probably come up with a T1 here if yours turns out to be unrepairable.

One coil in an R-4B had an external ferrite core that was a snug fit inside the aluminum can. There was a rubber washer between the bottom of the ferrite and the top of the header to insulate it from the wire terminals. After only about 30 years the header wires punched through the washer and shorted to ground, smoking the winding. The "top" of the header wires had been cut off with diagonal cutters, leaving a knife edge on the end of the header pushing against the bottom of the washer. When I found a replacement, the header wires had been bent over and THEN cut, leaving a nice smooth "side" against the washer.

Noodle10536 wrote:
> Garey, Well....with the help of a buddy who is a repair technician who is also familiar with the problem with my particular radio, we have narrowed it to one of the two coils. It is an intermittent short and if you wiggle and straighten the aluminum covers on these two coils it stops for a long time. They seem to settle back to a skewed position and then after months of use the short presents itself again. I am leaning toward it being T1. I plan to take them out one at a time and replace what is necessary, but I do not want to leave it apart while I am searching for the coils for fear that I will forget how to re-assemble it. So it was my idea to have both on hand to change them out all at once. I will be doing the repairs and replacement myself and I am certainly not an expert on the circuitry. I am a competent parts changer but not a complex circuitry troubleshooter. I have emailed about 6 people from the internet Drake pages and come up empty. If you may know of a source, please let me know. Thanks for your help, Peter KC2RBX

From: w1fued@sbcglobal.net
Topic: 2587 Message: 2587

The power transformer is shorted in the primary of my 1-a rx.
Looking for replacement, hopefully one with 12 volts for filaments. The 2a and 2b had only 6 volts for filament, but 4 line has 12 volts for filaments available. Please let me know what you might have.
Thanks,
Ed

I'm looking at Drakes on ebay and everywhere. Do I remember correctly that most Drakes use a standard 4 pin mic and need an un-powered mic as opposed to a pre-amp mic. I have a good Turner Plus 3 pre-amp model. Will it work? My only experience with Drakes was about 15 years ago. I was running FT 840's(because of their simplicity) and a ham friend "stored" his "Twins"(4B's if I remember right) at my place for a little over a year(his divorce). He did allow me to use them, not sure I would have done that but he knew I started with an HW 16 and had several HW 101's under my belt. I got hooked. I sold the FT's and Ameritron 22 months ago because of a "change of direction journey" I'm on (long story), now I have the old HF itch so, ergo, the Drake hunt begins. I'm presently looking hard at a TR-4C with no mike, therefore my question. tnx de WD5HXB.

So now we're sort of introduced...tnx agn for letting me join.

I used a Turner +3 on a TR-4 with no problems. Just keep the pre-amp turned down so you don't over drive it.

And yes, the Drake 4 series all use the Switchcraft .210 plug. The CW key jack is 1/4 mono plug.

Good luck with it, they are a lot of fun.

The PJ-068 is .209", not 1/4". They look pretty close to the same but the 1/4" will not plug in the smaller jack.

2593. TR4 for sale...agn

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-19 22:17:08 UTC
From: Butch Housman
Topic: 2593 Message: 2593

I've had a TR4 listed on qrz but have been so jerked around by would be buyers that I'm going to relist it next wk after I get back from a trip.

I think I'll go for $275 delivered in the lower 48. The transceiver is in very nice shape but the ps/speaker is a little rough & has a hum which I think may be mechanical issue, I get gud reports/ clean sig, 150 or more watts out. Rec audio sounds gud.

The radio comes w/ hand mike (shure element), original manual, 10 assorted spare tubes (1 final) & the MS 4 speaker/power supply.

This time around it will be sold as is, first $$ buys it, paypal or credit card. No more "hold it for a while & I'll send u a check".

It works fine & I will be happy to put it on the air but that will have to be after I get back next wk.

I've posted some pics of it:

http://www.housmanphoto.com/tr4.htm

I can be reached at 606-549-2181 or 606-344-0460 cell

Tnx & Best wishes,

Butch KA4MIC

Tnx for the kind reply. I've tried to price it for a quick sale. I already have numerous boatanchors & I'm wanting to clear some out....I have a nice clean Hammarlund 110A vhf that needs to go too.

As for the HUM, it never learns the words !
It hums from the instant it's turned on 'till it's turned off. The hum is consistant & seems independant of the rigs audio output or anything else. This is what makes me think it's a "musical" transformer of some kind. Not to belittle the problem but I've found this sort of thing to be a rather common "vintage" radio sound.....not saying it SHOULD be there or that it can't be cleared up, just common.

Principly I'm selling it 'cause I'm just not that much into Drakes, no offence. I'm from Dayton, Ohio so they're sorta home town radios. I've had or used half a dozen or so & never really liked the sound (shot out ears ???). I will say this one sounds better to my ears than any one I've had before. It seemed to me to be in very nice shape & I bought it cheap ....couldn't help myself !

I have a Knwd 520S & a HW 101, both of which I really enjoy so I just don't have the space to set it up. It should have a gud home, that's why I'm not breaking it up & selling it piecemeal on ebay. It's a complete set & will stay that way as far as I'm concerned.

Tnx for the gud vibes from the group, I've enjoyed it & will probably continue to read the mail.

I could call now but you mentioned a trip. Could you contact me "before" you list it again...I'm on a short budget and trying to gather the money as we speak, or whatever it is we're doing, emailing, I forgot. I thought seriously about a Kenwood TS 520,,,it was my first choice until I remembered my experience with Drakes...they can be cantankerous but I guess ego has something to do with it..I've owned a 520s and a couple of 101's, plus the HW 16,,,my first rig, and I had to wait on Jans Crystals to transmit...wow, I had 8 frequencies to work...4/80 meters, 2/40 and 2 /15...HOG HEAVEN...first contact was Finland, cw of course....not for an "old cb'er"...even on 11 meters I was a tad odd...ran a 5 channel Ratheon TWR 2,,,crystal...my VERY first radio experience.

I'll be in touch. I'd rather buy from a ham,,,and I hate that biddng on ebay and you never know what kind of whacko is selling,,,could have come vrom the bottom of a lake "boat anchor"? and they'd call it "Pristine" because the water was clear...hihi...tnx and I'll be in touch...de HXB.

See? I just can't even get away from the packet.....there's always 3 dots at the end of a line on packet to let other party know that "more to come"...tnx agn.

Here's what to do. Get ur $$ together & call me on the cell,

606-344-0460

If u have any further questions I'll try & answer them. I won't hold it for anyone under any circumstances.....that's what lost me 3 chances to sell it so far. I put one buyer off while holding it for someone who didn't come thru. No offence meant to u.

I'd suggest paypal, that will give u some protection in case I'm a total lying, ripoff jerk. That is not the case but paypal is also easiest for me w/ slightly less fees than a credit card.

My paypal address is:

2sue@...

The first person who deposits $275 in that account owns the radio. No returns.

It is heavy, & Drake says NOT to ship it w/ the PS mounted in the speaker. It will take at least 2 boxes & I'll ship it via UPS insured within the lower 48 states only at my expense.

It absolutely, positively is working & in the condition u see in the pics & as I've described. If u get it all busted up or DOA then that will be between u & UPS. I will back u up however I can from this end. I can probably take a short video of it playing & some shots of how it was packed as evidence but I expect it will arrive OK. They really don't mess up much.

I may check email from time to time over the next few days but the cell will be best.

Tnx,
Butch Housman KA4MIC

PS. I'm gud on QRZ

There must be something in the water. Thought this receiver sold twice, most recently to a "gentleman" (not a ham) who told me the "check was in the mail" evidently changed his mind, just didn't bother to tell me. He's back on the other Drake list wanting to buy an R-4.

I bought the receiver about 6 mos ago (evidently for more than it was worth), have done nothing except use it. Seems to work fine to me. 80M, 40M, 20M, 15M, and 28.5MHz-29.0MHz are the bands the receiver was originally supplied with and they all work.
It is an R-4, s/n 0506. I think it is in good condition operationally and cosmetically, but am by no means an expert. Even the AVC circuit seems to function properly. Got enthused with Drake gear awhile ago and went overboard buying stuff. There are no optional crystals and just a xerox copy of the manual. I'm selling it because own two R-4s and don't need but one, am keeping the one that is in better cosmetic condition. So, one more time, I want to sell one of my R-4 receivers. $150 + shipping CONUSA. Contact me offline for details. LICENSED HAMS ONLY.

I have a complete and unbuilt kit from radiokit for a TR4-C general coverage addition complete with cabinet.
i checked the parts and the only difference i can see is that instead of the knob and vernier, it comes with a vernier knob.
I will entertain offers for this and send it to the highest bidder.
If you have any questions please contact me off list. I can take pictures if needed. This has the Radiokit partslist and the QST article copy.

Check AADE..Almost All Digital or NZ3R..

Google either.

I use the AADE unit and it works well..is very stable..external of course. reads the injection freq and displays the op freq.

The AADE is also very easy to set up, works with many other analog recievers/xcievers, just scroll through the menu and go.

John

Check out Electronic Specialty Products.

http://www.electronicspecialtyproducts.com/

I have 2 of their displays (one for my B-Line and one for my GT-550A). They work great, are easy to set-up and have a nice blue display.

I made a slight booboo in my last post. The Digital readout that I was refering to is the DD-103 from Universal Digital Dial. I do have both and the DD-103 has more radios in the memory to chose from and is easyer to move about in the memory.

2610. Repair Update on TR-4Cw

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-21 05:04:09 UTC
From: Noodle10536
Topic: 2561 Message: 2610

Hi Everyone, I managed to pull the cans off the coils and inspect them. I can not find any evidence of shorts in the T1, T2 & T3 coils. I began looking around the underside of the radio and found that a previous owner had re-wired the V14 tube socket and that a capacitor on board 5 was probably never installed well and was loose and half out. I will double check the coils and cans and put them back together. I will then replace the R2 resistor and try to put the V14 socket back the way it sould be and fix the loose capacitor on Board 5. I have the correct 13DE7 tube and will hope for the best. After I am fairly secure things are right I will give it a smoke test. Thanks very much for everyone's help. 73 Peter KC2RBX

2611. TR 4 / TR 4C

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-21 17:46:26 UTC
From: DD
Topic: 2611 Message: 2611

What are the basic differences in the 4 and the 4C? I can see the dial is different...and heard the 4 didn't have a noise blanker and the 4C does...heard a post, can't find it about 6 volt filament voltage versus 12 volt filament voltage in some Drakes...??? Just worried about the diff between 4 and 4C...tnx de HXB.

2612. Drake TR-4 line INRAD AM Filter

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-21 18:11:42 UTC
From: Dale Parfitt
Topic: 2612 Message: 2612

I have for sale an INRAD #2311 9MHZ Center freq 6KHz wide AM filter. This is the filter to allow full AM TX and RX on the TR-4 line.
It is mounted on a double sided plated through holes PCB that has silver turrets for IN/OUT and full relay switching along with a 1/2 wave filter/rectifier for generating relay switching voltage.
Pix available. See the TR-4 AM articles on the WB4HFN site:
http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/TR4C-AM-Filter.htm
http://www.wb4hfn.com/DRAKE/DrakeArticles/TR4_AM-Filter/TR4CW_AM-Filter_01.htm

In my application the PCB and its metal mount attached to the CW filter for a clean compact installation.

$100 shipped CONUS.

2613. Selling Drake 4 Twins

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-21 20:30:35 UTC
From: Dan Galligan
Topic: 2611 Message: 2613

I have a T4X, R4A, MS4 and PS4 that I purchased as a project. When I bought them, I was told that they had a problem, and would not tune up, but had been tuning up, just a week before. I got them home and set them up, and got them tuned up, with no issues. I tended to think the problem was in the interconnects, but I am no technician, and can't be sure. It is operational, but something is not quite right, and I do not know what it is. The power supply looks to be all original caps, and unmodified, so will likely need a rebuild. The case on the R-4a has a corroded spot on the top front of the case. They definitely need cleaning up, and repainting the cases, in addition to the power supply rebuild. Otherwise, they performed well for me, for the short time I tested them. What they really need is someone with the knowledge and skill, who has the time to give them some tender loving care, and I am not that person. It is now more than a year later, and I have done nothing with it, so, it is time to sell, and let someone who is able, give it the attention it needs. It is not a bad set of radios, but it needs a bit of TLC. I want to get $300 for it, and my experience is that it will cost about $90-$100 to ship it, across the country. I'll split the cost of shipping, and for a total of $350, via USPS Money Order, or $360 for a PayPal payment, I will have it sent to you, anywhere in the ConUS. Alaska and Hawaii will be more. No international sales, please. Detailed high resolution pictures can be taken and emailed to you, for the asking. I have NOT yet taken them, as of writing this, but will do so today.

2614. Correction

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-21 21:55:56 UTC
From: Daniel Galligan
Topic: 2614 Message: 2614

I knew when I wrote the listing for the Twins I have for sale, that the power supply is an AC-3, NOT an AC-4 as I accidentally wrote. I simply did a typographical error. When I went to take pictures, I saw the AC-3 on the back and realized I had mistakenly described it as an AC-4. But, I now have several high resolution pictures available for anyone who asks. AND, I thought I ought to mention this, which I forgot to mention before. While I am not a smoker, and it (the set) has never been in a smoking environment around me, I did a little light cleaning up, for the photos, and I would have to guess it was, at one time, in a smoking environment. It's not grungy, but smoke residue is apparent.

2615. 2B won't hold frequency

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-23 15:59:08 UTC
From: n2chi
Topic: 2615 Message: 2615

I've got a 2b, new to me, that won't hold frequency. It varies by 200 to 400 cycles off the target frequency, most times sort of running up and then will immediately drop back down, but not necessarily.to where it was. I've re-seated the crystals and tubes. Vibration does not do it (when I bang on the radio), so I guess it's a component changing value, a voltage, etc.

I'm about to open 'er up, so any pre-surgical suggestions would be appreciated. For all I know, this is a common problem. But I did try to use the archives search facility, which yielded nothing.
Thanks,
Dave

Hi Dave,
While I have not seen this in my 2B's, I did have an identical problem in my Hallicrafters Cyclone. It turned out to be one of the tubular temp compensating caps in the VFO. They seem to go flakey after many years.
Others had the same problem with the Cyclone oscillators.
If it only occurs on one band- check that band's xtal.
Also look at the B+ on V3's plate to make sure it is stable.

Thanks, Dale, that's a good idea, to monitor the V3 plate voltage. I can do that easily and since the problem is steady, I should be able to tell quite quickly.
Thanks,
Dave

Or put the TX back to original condition by putting a 0.206 mic socket in it.

Just ran across an interesting thing that most of you probably already know but here it is:

For those who are interested in original Drake paint. That is a true baked powder coat finish, two part system and much more durable than a spray can job. The place to call is Hartzell Mfg. in Miamisburg, OH at 513-859-5955. vickroy@... They can repaint your cabinets to like new condx.

Came from http://www.qsl.net/n9bor/drake.htm

Hope to be on the Drake net in a week or two...tnx to all youse guys.

De HXB.

John,

I have changed the old element in the D-104 with the HC-5 element. But I have not had a chance to try it out on the air. I hope to have my TR-4CW back up and running in a week or so. Maybe I can meet you on the bands then? I am located in Southern New Jersey.

From: Jim Chaggaris
Topic: 2624 Message: 2628

John,

I installed the Heil/D-104 mod/kit a couple of years ago for my B-line and it works FB. I still prefer using my Heil Goldline Vintage, Shure 444D or EV664 over the Heil/D104 with the B-line.

Best Regards,

Jim N9WW

The audio using the D-104 sounds tinny. Maybe good for dxing but I was thinking of putting a Heil HC-5 element into it. Has anyone done this and how do you like the results?

Try butting a 470K (or larger) resistor in series with the element.

I have the d-104 with the HC-5 in it and its not much better then the stock D-104. Try and get your hands on a shure 444D mike and you'll be very happy. Thats what i use now on my "C" line and get great reports. I grabbed one up from Ebay in very good condition from a ham that was very into Drake and i think i paid around 60.00 $ for it.

Hi,
Changing the mic plug to 1/4 is never recommended. Right angle .206 plugs are available from Mouser and other supply houses and of course on ebay.
Drake designed these inputs so that an operator would not confuse the mic with the speaker. Collins used the same plug, likely for the same reason. Here's a great resourse for drake parts, and a very helpfull website. Many of us have contributed to this collection of RL Drake knowledge.
http://www.wb4hfn.com/DRAKE/DrakeArticles/TechTips/DRAKE-TECH-EXCHANGE-11.pdf
Yes, you can get 1/4 stereo plugs and jacks cheaply from many sources, but your rig is no longer original.
Good luck

Wink,

The Black lead is HOT, the White lead is neutral.

Connect the Black lead to the fuse holder where the lead from the
two-wire cord is/was connected.

Connect the White lead to the point where the other wire from the
two-wire cord is/was connected.

One of the first things I did after acquiring my Drake equipment was to
put a three-wire cord on both the AC4 and the R4B.

The purists may not like the three-wire cords, but safety is much more
important if the rigs are actually going to be used by someone.

Hi Wink!

I just recently modified my AC-4. Click here to my website.<http://forrest.3h.com/AC-3%20PS%20cabinet.html> Scroll down and you will see a picture of how I wired it. Smoke test - power supply, Drake TR 4, and operator survived without injury. I used a PC power cord with the connector to the PC cut off. Good luck.

Nice project Forrest,

Thank you for sharing the photos.

I like the handles, those pwr spplys are awkward to balance. I also used a pre-molded powercord (#14 wire) but a 12 footer so that I had more "slack."

2639. MN-7

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-26 17:19:23 UTC
From: Victor
Topic: 2639 Message: 2639

Hi
Have just acquired an MN-7 ATU but without handbook. Some of the connections and controls leave me a bit confused.
Firstly, it is fitted with a 1000 balun on the rear. Markings on the case next to the balun are as follows:-
Top connection Marked BAL
Middle connection marked NC - with Balun
Bottom connection marked Bal/LW (1:1 or 4:1)
BUT on this MN-7 someone has stuck a label next to the bottom connection and marked it No connection thus leaving only the top and middle connections available to connect a twin wire feed to.
This doesn't make any sense to me 'cos the middle connector says NC - with balun.
Any ideas, please?
Also, what are those damned slide switches for on the front panel?
I have a nasty feeling that this unit has been messed about with.
Cheers
Vic

Steve, Jim
Thanks for info. Have now found out a little more. This MN-7 has been slightly altered. The bottom terminal marked Bal/LW has been disconnected and connected to the middle terminal (NC) Those two terminals are for balanced feeders and the bottom is now NC. Don't know why and I don't yet know what the bottom terminal of the balun is connected to - if anything.

I'm not sure entirely what is going on there either. The bottom terminal has no internal connection in the tuner, thus is a balun-only connection. The middle terminal is grounded in all switch positions but 4. Maybe the previous owner was using this connection for a longwire? I would verify that there have been no internal changes made to the tuner, then operate it as per the manual. Maybe someone else has an idea. You'll probably get a definitive answer when Garey speaks up.

Vic -

The original setup with the B-1000 Balun essentially has the balun wired as an "auto-transformer", i.e., half the winding is connected across the unbalanced output of the tuner, and then the open-wire "balanced" feedline is connected across the full winding. There is no internal connection to the "bottom" terminal, just the "high" side of the balun, thus the "NC" indication on the "WITHOUT BALUN" diagram side. Put another way, the internal wiring to the three terminals doesn't change, just the labels.

The MN-7 is a very versatile tuner, capable of matching to just about anything, which is why it seems complicated.

All the combinations are described in the manual,

Hi Gary, Ken
Thanks for input.
It doesn't seem to work right.
Looking down into the MN there are two connections from the switch to the top and middle terminals of the balun. The bottom is NC.
So looking at the rear of the balun which two terminals should be connected to the switch and which NC?
Sorry to labour this.

Wink,

When you connect the black lead to the fuse holder, make sure that you connect it to the _far_ end of the fuse holder from the chassis so that when you remove the fuse, it won't still be in contact with the hot lead when it's partially pulled out and the near end is exposed.

Subject: Re: [DrakeRadio] AC4 3 Prong Wiring

Wink,

The Black lead is HOT, the White lead is neutral.

Connect the Black lead to the fuse holder where the lead from the two-wire cord is/was connected.

Connect the White lead to the point where the other wire from the two-wire cord is/was connected.

One of the first things I did after acquiring my Drake equipment was to put a three-wire cord on both the AC4 and the R4B.

The purists may not like the three-wire cords, but safety is much more important if the rigs are actually going to be used by someone.

Sounds like it is wired correctly. The top and middle terminals should
have wires, and the bottom terminal should have NO wire.

If you think of the B1000 as a center tapped coil, the RF is applied
across one half, and the antenna feeders are connected across the entire
coil. The result is a 4:1 "step-up" impedance transformation.

Garey and all

Thanks for bearing with me.

It seems it is wired correctly and I also think I have found the prob. On closer inspection I found that the board around the top terminal is charred and also the ' tinning ' around that terminal connecting to the balun has burnt away - hence no connection to the top balun terminal from the switch.

Will remedy that this p.m.

By the way, Garey, how are you these days? You seem to be very active again.

From: Ken Burchfield
Topic: 2639 Message: 2651

Thanks for the feedback. did you get manual and also check the files section and download the B-1000 info.
What Garey described is correct.
Vic look in the lower left bottom of the b-1000 file and zoom in on the dwg it is hard to see,but Garey's description will be clear.
Glad now that you will be able to resolve the tuner problem.// could be it maybe took a lighting strike./or.?
To: Garey hang in there ...I'm with you Myself had a Brain stem stoke in '91 so I know your type problem too.
73 to all

Garey and all

Thanks for bearing with me.

It seems it is wired correctly and I also think I have found the prob. On closer inspection I found that the board around the top terminal is charred and also the ' tinning ' around that terminal connecting to the balun has burnt away - hence no connection to the top balun terminal from the switch.

Will remedy that this p.m.

By the way, Garey, how are you these days? You seem to be very active again.

73

Vic

Ki Ken

Yep downloaded the manual for both the MN7 and the B-1000.

Fully understand what Garey meant by the balun being in effect an auto transformer (yep I did look at that little sketch in the bottom left hand corner)

Never thought about a lightning strike. I think that it is more likely that the terminal came loose with usage and the RF was arcing and burning.

All the best

Topic: 2656 Message: 2657

The flat, right angle plug for the side of the T-4XB is Mouser 502-S230.
The mating jack is Mouser 502-S-12B.

The Switchcraft p/ns are S230 and S12B.

The straight body plug, better for the T-4XC rear jack, is Mouser
502-S-260 or the 502-S267.

The "S" is important as there is ALSO a Switchcraft 230, 260 and 267,
but they are the 0.25 dia plug!

2662. AGC Distortion

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-11-29 15:38:55 UTC
From: jshea_n4dsp
Topic: 2662 Message: 2662

Besides Sherwood's mod for the AGC distortion with the R-4B is there anything that can remedy or help in this regard? I want to keep the rig original but at times the receiver quality sounds like I have a broken speaker cone. I turn the AGC to the off position at times. I may have asked this before but it doesn't come up on a search.

Thank You

john

John -

The Drake R-4 series receivers have/had one of the very best AVC circuits around. If it really sounds that bad, you have a problem in the receiver.

Does it sound better with the RF GAIN backed off?

Having the Noise Blanker on will certainly cause some problem on very strong signals. What is the serial number of your receiver? The early models had AVC applied to the Noise Blanker IF Amp (V9), which was removed in later models. If yours is an early one, a gassy V9 could be loading down the AVC.

12982C is the Serial number Garey.
The noise blanker is off and yes
backing down on the rf gain control
certainly does help. It is very noticeable
on cw and unusable in the "fast"avc position.

Don't feel bad. I've had the same problem for a few years now. I just run it in the "slow" position. Seems OK there. But you're right about the fast position. It is totally unusable. Since I'm only on SSB, it stays in slow and works fine for me. Guess I'm not particular about it. LOL Could be something as simple as a tube, who knows?

John -

Have you checked the decoupling resistors to each controlled grid?

I think what you are hearing is overload, which is either insufficient
AVC or "slow" AVC 'attack'.

I normally use SLOW AVC on CW, but just turned my R-4B to 20M and with
AVC in FAST and signals up to 20 over S9 and up, NO distortion is evident.

A gassy tube in V1, V4 or V5 could certainly prevent the AVC from having
sufficient control over a stage gain.

Something is NOT right.......

Just wanted to post to you and the group to let you guys know how much you are doing for the advancement of ham radio, and especially keeping Drakes alive...this group, and you, Butch made it possible for me to own a DRAKE...WOW...Dreams can come true. I no longer look for Eico's on e**y...hihi...thanks guys and especialy to you Butch...de HXB.

I'll be quiet now and wait "patiently"...hihi...not a chance...hihi.

Not to worry, if I turn it on and smoke comes out, I have a smoke-a-tron.....The idea came from an April (as in April Fools Day) edition of QST, long ago. Some hams decided that electricity wasn't the major thing that ran radios...it's needed but you can turn it off and turn it back on and it still works...they decided that all radios actually ran on SMOKE. They even did "experiments"...they drilled a hole in a transformer,,,hooked it up and the smoke came out of it and it NEVER worked again...so they designed a chip with a screw on it so you could attach it to the radio, unscrew the screw and "put the smoke back in"...for the fun if it I built one. Now it's useless,,,I'll have to build several,,,one for tubes, one for capacitors and one for resistors....theirs was for these "new" rigs. I'll be happy...that's the beauty of Drakes (tubes),,,they can be fixed with minimal equipment,,,and not "sent back to the factory"...tnx agn...de HXB.

P.S. They actually experimented to the point that they decided that Cuban Cigar smoke worked best but most any smoke will do in a pinch...hihi....de HXB.

2686. TR7A problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-01 20:33:00 UTC
From: wctaylor
Topic: 2686 Message: 2686

Before I tear into my TR7A, has anyone had a problem with the AM carrier level being intermittent? The radio works great on SSB but to get any power on AM I have to advance the carrier level control and then turn it back down. The next time I transmit, it may or may not have power out and I have to readjust the control again. I've checked and cleaned the control plus I notice the power level verses control position varies greatly from band to band.

Thanks and 73
Bill

From: Garey Barrell
Topic: 2689 Message: 2692

Both supplies are functionally identical and are fully interchangeable.

The TR-3 used 12JB6 Final tubes (3), while the TR-4 and all 4 Series Twins used 6JB6s. But the required filament _supply_ to ALL is 12.6 VAC.

Regardless of which supply you get, I would strongly recommend adding the AC-4R rebuild kit from The Heathkit Shop. The original electrolytic capacitors in ALL these supplies are about 20 or more years past their "expected" lifetime. At a bare minimum, replace the dual section capacitor in the Bias supply, since failure of this part can result in FAST and CATASTROPHIC failure in the transmitter, even while in Standby.

The AC-4 supply is a little simpler to upgrade with the AC-4, but will work in either supply.

Darrell -

It probably "could" be, but would require modifications to the receiver
as it had no option for a Noise Blanker.

The 6AU6 and 12AX7 are listed in the RCA Receiving Tube
Manual RC-19 (1959) and the A versions of both tubes in the
RC-24 edition (1965). The 6AU6A is identical to the 6AU6
except that it has controlled heater warm up time (11
seconds) for use with series string heaters. The identical
characteristic curve graph is printed in both books.
The 12AX7A is stated to have controlled noise and hum
characteristics and there is a section specifying the values
and how they are measured. This is not mentioned in the
earlier book. The 12AX7A appears to have been designed
especially for low level audio circuits. Other than this the
characteristics of the two are identical.

>

The "A" version of most tubes is an improved version. In some cases the heater is a controlled warm up as in the 6AU6A, usually for tubes used in a series filiment string. Others is for low noise and hum. The 12AX7A has a very small differance in the capacitance of the elements. You can usually use the A version as a subistute in most circuits without any problems. You can go the other way in non critical circuits.

If buying the tubes I would buy the exect replacement, but if I had them on hand or could get them free, I would not have any reserves about trying the tube.

"...recommend adding the AC-4R rebuild kit from The Heathkit Shop... At a bare minimum, replace the dual section capacitor in the Bias supply..."

Hello Gary,

I continue to debate about rebuilding my AC-4, because it is working ok, because the previous owner claimed to have re-capped it, and because kinda hate to "gut" it to install the AC-4R.

Having said that, will perform whatever preventative work is appropriate to prevent a "meltdown". Also intend replacing the two-wire AC with today's conventional three-wire.

So, if I replace the two-section C5 cap would that provide same prevention level as provided by an AC-4R for the bias failure.

I have the impression that your preference would be to gut the AC-4 and install an AC-4R rather than recapping one section ot the supply. What have you done with your AC-4 supplies?

Curt -

OK. If you know it has been recapped "recently" (in the last five years?) then you are probably ok. I would check the ESR of the Bias supply electrolytics and if ok then have at it! If you do not have an ESR meter, it's probably safest to replace the Bias caps and rectifier to give your best chance of trouble-free operation. BE SURE and check the primary line fuse! It should be a 5A (or 6.25A) for 120 VAC operation. Early supplies had a 5A, but it would blow occasionally if you just happened to switch it on at a line peak so Drake changed it to a 6.25A. I have found everything from the correct fuse, to a 30A ceramic fuse, to a piece of #8 copper wire in there! Even the correct fuse will not blow in time to save your Finals, but "may" prevent a fire.

I have several supplies, some converted, some not. I would not leave a T-4X/B/C or TR-3/4 "on" if I'm not in the room. I recommend the AC-4R simply because it essentially makes the power supply a reliable, "new" one at minimal hassle. There is certainly nothing wrong with sourcing new caps (hayseedhamfest.com) and diodes and "restoring" the original supply. The three-wire cord doesn't hurt anything, but any equipment of this type should be grounded directly without relying on the power cord.

Topic: 2689 Message: 2708

Thanks Garey,

After reading all you and others have said, I "pulled the trigger" and bought the AC-4r kit. Maybe less trouble and not much more expensive than recapping/redioding the original, and as someone mentioned, the "guts" of the AC-4 are enclosed anyway. Don't imagine it will matter much to a future buyer.

Thanks for mentioning the possible "fuse" issues, will CHECK all of my Drake gear for proper size fuses. Can imagine why any Ham would decide to install the wrong fuse, but suppose anything is possible.

BTW, like you, I NEVER leave the shack without turning off and unplugging all of my Drake equipment. I know unplugging is probably paranoid, but with equipment that is nearing 50 years old, my trust level is pretty low. The XYL would never forgive my hobby setting fire to our weekend home.

Thanks again and 73, Curt KB5JO

Joachim,

That is not the R4C serial number. I think the R4C numbers started at or around 16,000 (my R4B is serial # 16015) and go up to 29,000+.

>
> Probably nothing u would want, my "Gud" radio is an old TT Omni V (I like American made stuff) but I have some knwd & Heathkit rigs also, no 830. . The 830s is a great rig but finding a nice one is a little tuff. FYI the 530 S is VERY similar...seems like it's missing the notch filter as best I recall. They're a lot easier to find & cheaper. I recently bought one like new for $250 but it's gone now.

My interest in a set of twins is that I'm a MARS member & nothing I own will wrk in the 3-3.5 MC range. I understand I could add xtals & hit that w/ Drake twins.

If u wud like to put a $$ figure on ur rig I might be interested. U could contact me offlist if u like- cameraman@...

Best regards,
Butch KA4MIC / nnn0zei

Bill,

IIRC, carrier reinsertion happens on the 2nd IF/Audio board. That is where you want to look first. I would suggest looking for dirty/oxidized pins in the Molex connectors between the plugin boards and the parent board. This is probably the most common ailment with aging 7-line radios, and is the cause of many strange problems. The cure can be as simple as pulling all the boards and reseating them, but a good cleaning and sparing application of DeOxit doesn't hurt (don't use the spray, get the needle-applicator version or spray on a Q-Tip). When working with the aluminim card cage covers, DON'T overtighten the screws. They can strip easily. They need to be snug, but not lug-nut tight. Also check the various grounding tabs and fingers while you are in there.

It's quite normal for a given setting of the Carrier level control to produce different output levels by band (same on AM, CW, RTTY). You'll usually find that the Carrier level setting must be increased each time you jump up a band to achieve the same power output.

2724. PA1HFO PIN diode attenuator for the TR7 - new schematic

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-10 00:16:00 UTC
From: floydsense
Topic: 2724 Message: 2724

This nice piece of work by PA1HFO has been around for a couple of years now (see "The Drake TR7 Transceiver Renewed" at the WB4HFN website). Unfortunately, the several sources of this document all had an extremely hard-to-read version of the schematic diagram. I redrew the diagram today and will shortly post it to the files section here in PDF format. While re-doing it, I discovered an error in the diagram and took the liberty of correcting that, as well as changing the capacitor values to mFd.

It appears that this design allows one to adjust the ALC and pre-driver pots for maximum output on the highest bands, while eliminating the problem of oscillation in the PA brick on one or more of the lower bands when doing that. I'd be interested in hearing from anyone who has already implemented this modification.

A small point, perhaps, but you're looking for tube shields, not tube chimneys. The shields usually had nothing to do with cooling, while chimneys are used on some transmitting tubes to help exhaust the hot air outside the cabinet. There are tons of tube shields on eBay right now for very low prices. The best source I found in the past for the knob shaft springs are guys who sell knobs for antique radios (not ham radio gear). Here's one source: http://www.antiqueradioknobs.com/services.html and it appears that he refers to them as "spring steel fasteners". Others just call them steel "clips".

One other, perhaps more important point ....

V6 and V7 in the TR-4/C do NOT need or want a shield!! The "base" for the shield that is attached to the socket is all the "shield" that is required.

Hi Peter;

If you are looking for the flat springs that go in the push on knobs, let me know. I have a few of them from NOS knobs that I need to drill and tap for set screws, so I do not need them.

I am in the process of cleaning up an R4A and T4X that I got several years ago from a friend.

Also to the Drake owners here, is it considered ok to have the cases powder coated if the original is really bad? The paint on mine is not in verry good condition and I would like them to look decent.

They were in nonworking condition when I got them, so I had to go thru the TX, RX and redo the AC-3 to get them working well. I had a friend make several contacts on 80 meters and recieved good reports on them.

Thanks for letting me in befor recieving a ticket, I am working on that and should have one soon.

Jim.

2732. Drake T-4XC Schematics, confused

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-14 15:52:55 UTC
From: de_n7ioh
Topic: 2732 Message: 2732

I thought Drake only had two different schematics for the T-4XC but I have three different schematic numbers.

53173200181 which I interpret as May 31, 1973 sn's 20181 and up.

10077626670 which I interpret as Oct. 07, 1976 sn's 26670 and up.

2772300181 This one I am confused about. It's in a Drake original manual. I can only guess for sn's 27732 and above. Any idea what the date code is?

Thanks, Al n7ioh

From: w5kg
Topic: 2736 Message: 2736

Hello all. Name hr is Don and I have bought a TR4 w PS4. It is not here yet but look forward in getting it.
I have used drake stuff in the past but never owned one.
I will be restoring it in the next year and will take time in doing so.
At the present I am building a Homebrew Amp, working on an SB230 for a freind, and have a broken astron 50 ps on the bench.
Winter is full.
Again thanks for letting me in and hope to gain much from the group.
Don, W5KG

Hi Joe,
I don't know a Don; I don't think anyway.. Tim O'Shea (KY7Y) told me about the group, and mentioned you. Here's a snap of the shack..

I went out this morning and read and re-read the manual for the T4XC and then 'lit it off' for the first time. Got the bias set for the power supply but couldn't seem to get any response out of tuning the transmitter. Kinda figured it may have 'died of old age'. Before totally giving up decided to try (for the first time) tuning the receiver through the transmitter (is that called "duplexing")? Anyway, the system seemed to 'receive' better that way than simply turning on the receiver. Before powering everything down I tried one more time..... Don't know what I might have 'tweeked' in the interim, but the dummy load began to glow and I peaked the load and dipped the plate (following the book instructions of not loading it for more than 5 seconds in 'tune mode' without a 30 second rest) and had it showing 55 watts on the VSWR. Don't know if that's good or bad; BUT it's better than yesterday! I need to change the plug on that desk mike (robbing the plug off my Plantronix aviation headset) and then I'll see what happens..... (I've got a 10 meter and 20 meter dipole in the attic). (I've gotten all the way to southwest Reno {from northeast Sparks} with that HR2510 on my 10m dipole! REAL DXing, Hey!!)

I don't race with SCCA. I don't care for their attitudes regarding vintage racing and vintage racers. I race with HSR-West (Historic Sportscar Racing-West) and HMSA (Historic Motor Sports Assn). Been in the sport for ten years now. Here's a quick snap of the Lotus from California Speedway a couple years ago:

Give me a note offnet if you don't want to bore everybody else (carlynneracing@...) , or 626-2788 until I can get the "wireless" up-n-running..
Carl KF7GJO

Hi Carl...Sorry...Yes..I know it was Tim...I asked him to invite you when I heard you had Drakes. Great pieces of equipment....I was brain dead when I sent you the note.

Pictures cannot be attached here.....they would have to be sent to the images section, however, race cars are not really on topic for the group. As I am an ex-SCCA member and racer, I would love to see it, so perhaps a private email to me, WA6RKN@... would be apropos. (Hint Hint!!)

2739. Microphone Woes

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-15 01:36:47 UTC
From: Carl McLelland
Topic: 2739 Message: 2739

Hi Guys N Gals,
I promised you lots of questions... you were forewarned.

My Drake R4C and T4XC were a gift from a friend (K6UKZ) to entice me into becomeing a Ham. These were his radio's decades ago. The transmitter didn't come with an original mike but my friend gave me an ElectroVoice model 638 desk mike to set up. I also purchased a CW key to practice and learn code. This morning for the first time I went through the manual and with my dummy load insured that the transmitter was aligned and worked. My dummy load 'shined brightly' and the VSWR was showing 55 watts output in "TUNE" mode. OK, those are the givens.....

The microphone jack on the back of the T4XC is a three wire jack (tip, ring and shield/gorund). I 'salvaged' a three wire plug from an old aviation headset. The plug on the EV mike had the red and clear wires connected to the two pins on its plug and the black wire was soldered to the shield. The red wire read '1' on my ohmeter and '0' when the mike was keyed. I connected the red wire to the tip of the plug, clear wire to the ring and shield to the ground. I plugged it into the jack, powered up the radio and..... Lower sideband, dummy load, 40 meters: transmitter keyed up showing 60 watts on VSWR without keying the mike. Keying the mike stopped the transmission; dummy load dark and '0' on VSWR.

Before I go any further, is this simply a case of reversing the red and clear wires, or do I have other issues?

Next, I wired up a plug for the CW jack. Now this seems easy enough for a Caveman to do. Plugged it in, turned on the T4XC and R4C. After they warmed up, switched the T4XC to CW mode, still on the dummy load, and closed the key. The VSWR needle jumped then dropped back to zero. It did not remain keyed with the key closed, the needle remained at zero and no dummy load light. Continuing to tap the key returned the same result; momentary jump on the VSWR needle then back to zero.

Decided I was "2 for 2", and before I scattered my power supply and/or transmitter finals to the four corners of the globe, shut everything down and waived the white flag.

Now before suggesting I connect the forscene to the caloritis, cross jump the J-79 to the N3 in the Flux Capacitor, recognize I'm barely able to function past "ON/OFF". Ya gotta speak slowly and with small one syllabul words. (As I constantly have to remind my cousin {WA6QBU}, "speak VW, not Porsche"). Can any of you offer any suggestions? The manuals I have for each piece of gear are in English except the technical stuff which was written in Swahili by a Geek on a three day bender.

If you offer a suggestion I'll try it. If it's beyond my ability I won't try it. If this were an engine I'd dive right in because I'd know when and where to stop and who to contact if I had problems. Unfortunately it's not an engine, it's a radio, and takes me back to the "ON/OFF" level of knowledge.....

Thanks in advance...
Carl KF7GJO

How long has it been since this rig was last used ?

As I understand what ur saying, when u key it in CW u only get a momentary output of 60 watts & then it goes to zero ???

It should put out 150 w or more.

R u tuning it as per instructions in the owner's manual or just for max output on a seperate meter ?

Can u hear the relay clicking ?

Have u ever tuned a tube rig before ?

Given the choice between brown or black shoes.....what's ur pick ????????????

Butch

Jim, If you had two of the flat springs to spare that would be outstanding. There may be a way to email through Yahoo but I am not familiar with the process. Please email me at my call sign (KC2RBX) at ARRL.Net. Thanks very much, Peter.

Floyd & Garey, Thanks for the clarification on the chimney shield terminology correction. I guess either way it is moot with respect to the location where I had intended to put them. Strange that the V6 and V7 tubes have bases that afford the shield attachments yet non are supposed to be used there. I have been making what I believe to be good progress on the radio though. It won't be long before I perform a smoke test for leaks. It sure looks a lot cleaner and neater inside it and I was able to locate some problems or potential problems. In some instances, changes have been made ti=o the radio that I am trying to return to its stock form. I think I will retain the AM filter mod but will make a better bracket for it to attach to. Perhaps this weekend will afford me some time to finish up and give it a test drive. Thanks again for everyones help, Peter. KC2RBX

Hi Butch,
How long has it been since this rig was last used ?
It was last used about 20 years ago. The owner left it at his parents when he went to a Pentagon assignment and bought a new rig there.

As I understand what ur saying, when u key it in CW u only get a momentary output of 60 watts & then it goes to zero ???
On CW, the needle doesn't even get past 10 watts. Just a momentary 'jump' then drops to zero, and nothing to the dummy load. In TUNE mode this morning was hitting 55 watts, and with the 'errant microphone' was showing around 60 to 60+ watts.

R u tuning it as per instructions in the owner's manual or just for max output on a seperate meter ?
I tuned it according to the owners manual, but that's not to say I didn't do something wrong. This was the first time I ever did it and didn't have anybody standing behind me saying "Oh Oh..... You shouldn't a done that......!" Since I don't really understand what I'm doing tuning it, I've tried to follow very closely to what the book says.

Can u hear the relay clicking ?
I don't recall if there was a relay clicking or not.

Have u ever tuned a tube rig before ?
Nope. And I've never flown a B2 bomber, either. (Flown a B-52 though.. Flies about the same as a Freightliner tractor/trailer with 18 flat tires).

Given the choice between brown or black shoes.....what's ur pick?????????????
Black Corcoran Paratrooper jump boots, SIZE 12ee. Best to get them at the 82nd Airborne commisary at Bragg; more expensive at the Smokebomb Hill PX.

Carl (Tried to be as analytical as I could, Butch; then met 'humor with humor'..... (Xcept I really have flown B52's..)

Hi Peter;

I sent an email to your Arrl address so watch for it. I have 3 of the springs that are surplus to my needs.

I hope they will work for you. The knobs came from John Kriner a few years ago and are NOS Drake knobs, so they should be the right springs.

Jim Burlile.

Hi Carl. THe CW issue sounds like you need to turn up the vox delay. The Vox delay is active on CW as well as the voice modes.

If it is all the way down, it does exactly as you describe. You probably need to get the wiring diagram for the mike and the t4 and make sure they are wired the same. Some mikes do odd things with the switches since they are really set-up for audio and not nec PTT with a radio.

Thanks Kurt, will give that a try when I head back out to the shop.

As if this isn't confusing enough, besides the EV desk mike that I want to use for obvious reasons, I've also got a Shure hand mike (4 wire, no plug on it) and an Astatic mike with a 2 pin plug. I've ran ohm checks on all three mikes now looking for the pattern to figure out how the wiring is different and where its similar. The one 'constant' is that all three are different.

Just so I'm on the right page regarding the VOX thing, when using VOX you still have to key the mike, correct? The VOX (with an 'open mike') stops transmitting when nothing is being said, hence nothing to transmit; and when it senses your voice starts transmitting again. At this point I don't care about VOX, I just want to make it operate, then I'll start "polishing the chrome".

I was really blown away when I plugged in the CW key and it wouldn't work correctly.
Carl

Also..is there an on off switch on the microphone besides the main PTT switch?

> Hi Guys N Gals,
> I promised you lots of questions... you were forewarned.
>
> My Drake R4C and T4XC were a gift from a friend (K6UKZ) to entice me into becomeing a Ham. These were his radio's decades ago. The transmitter didn't come with an original mike but my friend gave me an ElectroVoice model 638 desk mike to set up. I also purchased a CW key to practice and learn code. This morning for the first time I went through the manual and with my dummy load insured that the transmitter was aligned and worked. My dummy load 'shined brightly' and the VSWR was showing 55 watts output in "TUNE" mode. OK, those are the givens.....
>
> The microphone jack on the back of the T4XC is a three wire jack (tip, ring and shield/gorund). I 'salvaged' a three wire plug from an old aviation headset. The plug on the EV mike had the red and clear wires connected to the two pins on its plug and the black wire was soldered to the shield. The red wire read '1' on my ohmeter and '0' when the mike was keyed. I connected the red wire to the tip of the plug, clear wire to the ring and shield to the ground. I plugged it into the jack, powered up the radio and..... Lower sideband, dummy load, 40 meters: transmitter keyed up showing 60 watts on VSWR without keying the mike. Keying the mike stopped the transmission; dummy load dark and '0' on VSWR.
>
> Before I go any further, is this simply a case of reversing the red and clear wires, or do I have other issues?
>
> Next, I wired up a plug for the CW jack. Now this seems easy enough for a Caveman to do. Plugged it in, turned on the T4XC and R4C. After they warmed up, switched the T4XC to CW mode, still on the dummy load, and closed the key. The VSWR needle jumped then dropped back to zero. It did not remain keyed with the key closed, the needle remained at zero and no dummy load light. Continuing to tap the key returned the same result; momentary jump on the VSWR needle then back to zero.
>
> Decided I was "2 for 2", and before I scattered my power supply and/or transmitter finals to the four corners of the globe, shut everything down and waived the white flag.
>
> Now before suggesting I connect the forscene to the caloritis, cross jump the J-79 to the N3 in the Flux Capacitor, recognize I'm barely able to function past "ON/OFF". Ya gotta speak slowly and with small one syllabul words. (As I constantly have to remind my cousin {WA6QBU}, "speak VW, not Porsche"). Can any of you offer any suggestions? The manuals I have for each piece of gear are in English except the technical stuff which was written in Swahili by a Geek on a three day bender.
>
> If you offer a suggestion I'll try it. If it's beyond my ability I won't try it. If this

were an engine I'd dive right in because I'd know when and where to stop and who to contact if I had problems. Unfortunately it's not an engine, it's a radio, and takes me back to the "ON/OFF" level of knowledge.....

In CW, the VOX circuit controls the TR switching. Now, I'm bsing this on the t-4x, but recall that it is the same. It works this way because the sidetone for hearing your CW work all works thru the Vox/Mic audio section. So yes, you need the vox setting to hold in the relay.

For the mics. Here is the poop. Mostly: one side of the switch and one side of the mic element share a ground line or shield. then the mic element runs out one line and the PTT switch out the third.

That is the setup that occurs inside the Tx. Now, some microphones are set up that way and some bring all the wires out to the cable seperately--in which case you just connect them together inside the plug anyway.

Try this--push the PTT switch on the mic and check which wire shows zero resistance to the shield. this is the PTT Switch. it should show infinite res when you release the switch. the other wire should show a high resistance but not open when measured to the shield--this is the mic element.

There are many variations on mic wiring so search for a diagram for your mic if this is not how it is set up.

EV was known for using 4 pin connectors on mics so by changing the pins you connect to, you could change the impedance of the mic output.

But if the mic cable has two wires plus a shield, the above should work.

Carl -

It is NOT necessary to do anything with the microphone for CW operation. In fact in doesn't even need to be plugged in.

Turn the ANTI-VOX full CCW, the VOX GAIN full CCW, and the CW DELAY full CW. Set the front panel GAIN control to about 10 o'clock. Close the key and increase (CW) the VOX control until the relay pulls in and then immediately dip the PLATE control (adjust for minimum plate current). Then release the KEY, and turn the CW DELAY control CCW until the relay drops out. Close the KEY momentarily, and the relay should pull in, hold for a second or so, and then drop out. Adjusting the CW DELAY control adjusts how long the relay stays closed AFTER the KEY is opened.

For SSB operation, the SSB DELAY control sets how long the VOX stays pulled in after you stop talking.

If you switch to the TUNE mode, no mic connected, the relay should pull in and the output should show full power (130W OUTPUT or so) at about 10 o'clock on the GAIN control. Switching the FUNCTION switch back to SSB should cause the relay to drop out after "some" delay. This delay is adjusted with the SSB DELAY control, and is separate from the CW delay setting. If this works ok, but talking into your mic with the FUNCTION switch set to SSB does NOT produce output, then there may be a problem with the mic or it's internal or external wiring. Many microphones open the "audio" line internally until the PTT switch on the mic is closed, and this must be bypassed for this mic to work on VOX.

Curt,
Mucho Gracias, Danke Shoen, and thank you very much for the previous suggestion on the CW key. Changing the VOX gain did, in fact, bring that to life. (Don't know anything in code except "SOS", but CW seems to work on my dummy load now).

The other email is correct regarding the mike... That's what I've got. There are four wires in the cable. Black, Red, Clear (transparent insulation) and the shield. The black and shield are soldered together at the mike switch relay, so they are in effect one wire. That leaves the clear and red wire, and with a three wire plug only two possible ways to wire it. The clear wire is the one that goes to the mike. I believe I wired the red wire to the tip and the clear wire to the ring on the plug. I'll reverse them when I get back out to the shop, and let you know what happens...

Thanks very much for your assistance!!
Carl

Hi Carl.

Welcome to the group. And congratulatins on the new ticket.

You will find all that you would ever need to know about Drake Radios from the collective wisdom represented within these posts. It's a great bunch of fellows.

Just one observation...

Operating from "Sparks, Nevada" - you must either be in the best possible place - or the worst possible place from which to operate ham radio. I love the name.

OK..you can definitely check that wiring scheme using the resistance checks I mentioned. It may be that they are reversed like you indicate since you said that the tx turned on when you plugged it in..

Garey has the complete info on the delay pots..sounds like Drake separated the CW and SSB delay and sensitivity (Vox Gain) in your version. It saves having to re-adjust when changing modes. Depending on the speed you send CW, the delay will need to change so the tx doesn't drop out every word or every character. At 20WPM, delay can be pretty short. Sounds like you will spend some time getting up to speed on CW--loads of fun.

I would "guess" that the clear wire is the mike element, but would still check it to be sure.

Make certain you have identified the barrel, ring, and tip connections correctly. Sounds trivial but I have seen some that are hard to tell ring from tip at the rear connection end.

As Garey also mentioned, you need a little bit of vox gain--CW gain in your case, to get the key to actually engage the relay..sounds like you have enough already since you said it tripped the relay but didn't stay engaged.

Let us know how it goes..look forward to hearing them on the air.

BTW..used my twins this weekend for the SKCC (Straight Key Century Club) 24 hour weekend sprint. CW Only I worked only 20 and 40 Mtrs. 106 contacts with other members..41 states/countries/provinces using a single wire 40M windom.

Curt

Have fun.

Sooooo.....

By now u should have plenty of things to check out, hope u can solve it from that.

The reason I asked abt the relay noise is that, w/ age, the relays sometimes need cleaning. If a dirty relay turns out to be the problem u will have to hunt that out & work a piece of paper (a small strip cleanly cut from a dollar bill wrks gud) soaked in cleaner between the contacts. I prefer non lubricating cleaner, DeOxit is best. U may also have a tube issue.

Others have already discussed mics, a dirty switch or bad cord there can also mess u up. It shouldn't enter into the picture in CW position tho.

If u have the manual & understand what everyone has told u abt the tuning procedure u should also be gud to go there too. Personally I never could exactly get used to the drill on a Drake.

Any tube rig can generally be tuned up abt the same way if u have an external watt meter. They all generally have 3 knobs, Tune, Plate & Drive, altho they may be called something else. The Drive may be called Preselector or some such.

U set the Drive first & u can set it roughly just by listening while u turn it. At some point the received sig will be stronger.

The Plate control will generally have a scale around it telling u approximately where it should be set to start with.

Once u have set the Drive & Plate knobs approximately u key the rig & adjust the Tune control for max output. That should get u in the ballpark. From there u alternately tune the rig using both the Plate & Tune control alternately. U MAY also need to touch up the Drive but generally not much. Don't lay on the key, u can burn up finals just tuning.

If u don't have an external meter most rigs have an RF or RF Output or RF Volt position on their meter & that will indicate relative output. Even if u don't have that....not to worry. If u alternately turn the Plate & Tune controls until u get the lowest plate current reading it will also have the maximum output.

What's happening here is that the tubes have an output impedance that is far removed from what the antenna is looking for so tube rigs need an impedance matching circuit built in....that's what ur adjusting. It also allows tube rigs to operate w/ ants that a transistorized rig couldn't handle, generally up to abt 3:1 SWR or at least 2:1.

Hope u get it squared away,

Butch KA4MIC

Curt, Butch, thanks for the input; I appreciate it.

Here is what I've read on the EV mike. as I previously said, it has 3 wires plus shield. The black wire is soldered to the shield so they are one. Then a Red and clear wire. Ohm measurements are unkeyed and keyed. Oh, the readings were taken form the plug tip (Red), ring (Clear) and barrel (shield/Black). There is one wire that goes TO the mike. It's the clear wire. Now I don't know if that makes a difference with its location on the plug (tip or ring) with regard to what generates the (vocal) signal, but look at the resistance readings:

shield to red unkey 1176 ohm key '0' no reisitance
shield to clear unkey 1176 ohm key '0' no resistance
red to clear unkey '0' no resistance key '0' no resistance

Now in my (somewhat) warped logic, I would think that when the mike is UNKEYED there should be total resistance (reading of '1' on ohm meter) on either red and/or clear wire through the mike. In other words, it seems to me there should be a 'break' somewhere when the mike is unkeyed, and that isn't happening. That condition is confirmed because the transmitter is keyed (transmitting to the dummy load) even when the mike is unkeyed.

Now I just happen to have an Astatic hand mike lying here, so I took a look at the readings on that. It, too has three wires plus shield: Black, Red and Clear. I did the same tests to it that I did with the EV mike. (It's NOT connected to a plug; just bare wires).

shield to black unkey '0' key '0'
shield to red unkey '1' key '0'
shield to clear unkey '0' key '1'
red to clear unkey '1' key '1'

We can disregard the black wire on the Astatic mike; it seems to be permanently grounded to the shield. It looks to me that the red wire, keyed, completes the required circuit when the mike is keyed so that audio (voice) would, indeed, arrive at the radio to be transmitted. Now I don't know if the 'red' wire should be attached to the tip or ring on a plug, but there IS a difference between that mike and the EV mike.

I might attach the Astatic mike to a plug I have and see what happens, but rather than experiment I'm going to see if I can come up with a 'bona-fide' mike that is working on a Drake transmitter. I'm hopin' Joe Wolfe might want to come by and have a personal look at the gear, and if he had an operable mike in his back pocket.....

THAT would solve a whole bunch of problems.. Determine that (1) my AV mike is bad, (2) the rest of my gear is working good, and most important: someone who knows Drake gear to lead me by the hand through the setup and tuning procedure... thus reducing the likelyhood MY finals will come reigning down upon HIS rooftop instead of Santa's sleigh and eighteen raindeer (hauling all that new HF gear to his house).....

Good News is that (again thanks to y'alls aid) I believe the CW problem has been resolved!!
Thanks guys and 73's around!!

Subject: [DrakeRadio] Re: Microphone Woes

In CW, the VOX circuit controls the TR switching. Now, I'm bsing this on the t-4x, but recall that it is the same. It works this way because the sidetone for hearing your CW work all works thru the Vox/Mic audio section. So yes, you need the vox setting to hold in the relay.

For the mics. Here is the poop. Mostly: one side of the switch and one side of the mic element share a ground line or shield. then the mic element runs out one line and the PTT switch out the third.

That is the setup that occurs inside the Tx. Now, some microphones are set up that way and some bring all the wires out to the cable seperately--in which case you just connect them together inside the plug anyway.

Try this--push the PTT switch on the mic and check which wire shows zero resistance to the shield. this is the PTT Switch. it should show infinite res when you release the switch. the other wire should show a high resistance but not open when measured to the shield--this is the mic element.

There are many variations on mic wiring so search for a diagram for your mic if this is not how it is set up.

EV was known for using 4 pin connectors on mics so by changing the pins you connect to, you could change the impedance of the mic output.

But if the mic cable has two wires plus a shield, the above should work.

It sounds like the mic is wired OK, a lot of EV and other old mic info
is at http://www.coutant.org/

Radio mic diagrams at http://www.dxzone.com/cgi-bin/dir/jump2.cgi?ID=15709

I have several old mics wired for my Drakes, will be glad to try and
confirm your readings.

Since I'm coming in mid stream, what kind of Drake is it?

Howdy Lou,
It's a Drake R4C, T4XC, MN-2000, MS4(?) power supply/speaker. T'was a gift from an old friend to get my licenses so I could talk on it instead of just listen. I've done "My Part" (just got my General) and now I'm struggling to get this gear on the air. I'll take a look at those websites after dinner.

Thanks.. and 73's

Great setup, you have the manuals? The tuneup procedure is in there,
but just copy out the one page you need and tape it to the desk. After
a few times you won't need it anymore. Drakes are actually pretty easy,
although they may seem daunting at first.

Pardon me if I am posting something that has already
been posted or answering the wrong question.
At least on the B and C line stuff the connector is wired
for shield and ground on the sleeve, audio on the ring and
push to talk switch between ground and tip. The switch
should close to key the transmitter.

Yep..thats the scheme on the T4X also..

What is the 1 and 0 stuff on the ohmmeter? I get 0, but where is the threshold for a 1? Why not a real resistance?

Looks like the astatic mic is correct.

Gud to get a known good setup and someone familiar with the rig to help for sure.

Curt

>warped logic,

Maybe semantic disconnect ???

>I would think that when the mike is UNKEYED there should be total resistance (reading of >'1' on ohm meter)

Excuse me for being so basic but let's talk abt reading ur ohm meter ....I just want to be sure we're on the same page. Assuming u have an analog meter, for "Infinite" resistance or no contact...an open circuit, the needle should not move from the left side. For a closed or shorted circuit the needle should swing full scale right to "zero" ohms.

Someone please correct me if I'm wrong but I THINK the mic tip on a Drake is PTT, so w/ ur meter connected from the mic tip to the shield ur meter should read full scale or zero ohms when u press the button & infinity or NO needle movement when the button is not pressed. The ring to tip reading should be a few thousand ohms, maybe just 1K ohms & should not change when u PTT.

Is this right u Drake experts ???? (I think so)

U might also try connecting the meter tip to shield, press the button & jiggle the cord, stretch it, bump the mic, move the button etc. If it doesn't show a constant closed circuit then u have the dreaded "Terminus Intermitus". Best thing to do then is shoot the mic repeatedly w/ a handgun of at least .357 caliber. Be sure to take it outside first. Trust me !

b

PS. Cut the plug off first, the damn things r worth almost as much as the radio.

You got it right Butch.

I have been watching this thread for a while now and so far you seem to be the only one with an answer for a new Drake owner.

Assuming you mean ring to shell (ground), not if this is a proper high-impedance mic. DC resistance should be on the order of a few thousand K-Ohms to several hundred K-Ohms, or more for ceramic cartridges. If it's a low impedance mic, it won't work very well without a matching transformer.

>Best thing to do then is shoot the mic repeatedly w/ a handgun
>of at least .357 caliber. Be sure to take it outside first. Trust me !

Or just repair the mic, which usually involves putting a new cord on it or repairing wiring that has been hosed up by a previous owner. Some of these vintage mics are worth their weight in gold, even non-working. And they often sound better than what is out there now, expecially on Drakes.

Carl,

I dissected a EV 638, which I suppose is close to yours. At one time I used this with my Drakes. The PTT, Red to ground, is infinite until switch closure then almost zero. The audio line, clear wire is about 18 Meg Ohms until PTT closure then about 1.2 K Ohms. Red is tip, clear is ring, black and audio shield in barrel.

My Drake 7075s have a higher resistance in audio but otherwise the same. I have also used Drake mics, Heathkit mics, D104 and Turner amplified mics and all were wired the same. So at this point I think you just have a problem in the mic. Would try looking and continuity testing on the wires, check PTT switch in the mic, wiring up from the switch to element.

Not sure I understand what measurements have been made.
Some microphones have push to talk switches which have
two (or sometimes more) sets of contacts: one provides a
contact closure to key the transmitter and the other is in
series with the microphone element to eliminate audio when
the mic is not keyed. I think the idea of this is to prevent
VOX operation in some transmitters during PTT use. The
contacts may be arranged so that they can be wired to either
short or open the mic line when not actuated.
An example of such a microphone is the Electro-Voice 600
Series, a moving coil hand-held mobile mic. The cord has at

least four wires so that the mic line and keying switch may be completely separated. The Low impedance version has enough wires to provide a balanced output if desired. The choice of switch methods is up to the user and is selected by moving wires on the switch.
The resistance of a pure contact closure should be essentially either an open or short (of course, there will be some contact resistance and some wire resistance if you want to be annoyingly picky). Resistance of more than a couple of ohms when the switch is closed suggests the switch contacts are dirty.
The resistance measured across the mic element will depend on the element. Usually, a dynamic mic made for a high-impedance circuit will have a matching transformer, measuring accross the element leads will measure the resistance of its secondary. This will be, in general, lower by quite a bit than the impedance. Some low-impedance dynamic mics have the voice coil connected directly; without a transformer, they will typically measure from about 10 ohms to perhaps a couple of hundred ohms. Most moving coil elements have an impedance of around 30 to 50 ohms but some are wound for around 200 ohms to save the cost of the transformer. The DC resistance will usually be on this order or a bit less.
A crystal or ceramic mic looks like a capacitance so it will have virtually infinite resistance when measured with an ohm meter.
Of course, this is for pure old fashioned mics which are without internal amplifiers or electronic switches of some sort. If it has either all bets are off and one must examine the circuit diagram to figure out what sort of values will be measured.

The thread has gotten so long & confusing to me by now that I can hardly follow what's been suggested.

Right on the digital meter, I just couldn't figure out his readings.

I'm sure there r plenty of folks on this list who know much more abt Drakes than me. What we have here is an old radio in unknown condition & a user unfamiliar w/ boat anchors....a challenge.

U can tune 'em up w/ a light bulb & a paper clip, u just gotta know how !

Carl, I'm gonna stand by 'till u can sort thru this mess & get back to us. Don't get discouraged, one knob set wrong can completely mess u up & even if the radio does have problems it can almost certainly be made to work.

Butch KA4MIC / nnn0zei

PS. I was just joking abt shooting the mic. Given 48-72 hours of intense struggle, 3 gallons of coffee, 2 new cords & a couple of burns from the soldering iron even an intermittent mic can be repaired...temporarily. U gotta luv this old junk !!!

The thread has gotten so long & confusing to me by now that I can hardly follow what's been suggested.

What we have here is an old radio in unknown condition & a user unfamiliar w/ boat anchors....a challenge.

Thanks, Butch. That's a very adept and correct observation. In all my life of talking on a radio; to include 17 years of air traffic control, 20 years of law enforcement and 3000 hours of flying airplanes, when you wanted to talk on the wireless you brought a microphone up to your mouth and pushed a button commonly referred to as a PTT, which I've always believed meant "Push To Talk". Never had or used a "VOX" before. To me, "VOX" was a brand of audio amplifier made popular by the rock group "The Beatles" in the 60's.

OK, I'll give it one last shot here.....

I DID indeed find a short in the cable to the ElectroVoice mike. I was very curious why it had current flow between the shield and both red and clear wires when the PTT was unkeyed, and the red and clear wires were open with no resistance. After fixing that problem this is what I now have in the EV microphone.

Red to Shield operates PTT unkeyed no current flow and keyed current flow and no resistance
Clear to Shield current flow with resistance whether keyed or unkeyed
Red to Clear no current flow between these wires when unkeyed, current flow with resistance when keyed

I haven't connected the wires to the plug yet, but from another email it was confirmed the Red wire goes to the TIP, Clear wire to the RING, and Shield to the BARREL.

Now, to further confuse myself, I also have an Astatic hand mike. This is what I found with it:

Red to Shield operates PTT unkeyed no current flow and keyed current flow with no resistance
Clear to Shield current flow with no resistance when unkeyed, no current flow when keyed
Red to Clear no current flow whether keyed or not

CONCLUSIONS:
On either mike, the red wire is the one which controls the PTT switch.
On the EV mike the Clear wire flowed current with resistance whether keyed or not, and on the Astatic mike was open and no resistance unkeyed and no current when keyed.
Lastly, on the EV mike, between the Red and Clear wire there no current unkeyed and current with resistance keyed. On the Astatic mike there was no current whether keyed or not.

This makes me believe the EV mike may be designed to work with a VOX system where the Astatic mike designed to work in a NON-VOX system. Is this a correct assumption?

BEFORE I wire a mike to the plug I want to make certain I have the Correct Mike to wire. So I'll wait until I hear from someone who knows......

Secondly, one of you wrote a detailed list of steps to adjust the VOX and I'll follow that when I next light this thing up. Thank you.... I made a checklist to follow so I will tweek the correct knob in the right sequence.

ONE FINAL QUESTION.... Is there a way to turn the VOX completely off? While it may be the greatest thing since plastic snow cones, it's something I can just as easily live without. All I want is to be able to key the mike and have what I'm saying be transmitted. Maybe I'll one day be happy to have it but for now I just want to be able to key the mike and talk; and I see VOX as preventing that from happening.

Thanks guys....
Carl

Turn the SSB Vox control all the way CCW will essential prevent ti from activating..then u must use PTT.

OK Carl, ur last email was all abt the mics, we can get that squared away I'm sure.

The shield is going to be common to both the ptt & the element so u know where to solder it. Whichever wire makes & breaks w/ the ptt button should be soldered to the tip. The one left over goes to the ring......deceptively simple.

In MY mind the bigger question is whether or not the rig has problems or whether it's pilot error. Sooo.....setting the mic aside for a moment, can u get the rig tuned up & how much output do u have ? If u have a dummy load I'd suggest u just try to tune into that first. What kind of ant. r u using ??????

Carl,

As has been pointed out, not all mics are created equal. The wiring is dependant on the intended application, and the color code of the wires has varied over the years. The "standard" colors of red, black, white (clear) and shield has become a rainbow mix. I have had to take apart more mics than I can remember over the years to decipher how they were wired and bend them to my will.

PTT is a switch contact closure. Plain and simple. Depending on the mic, this can be a closure to ground (the frame of the mic), shield, or another wire of whatever color. There can also be a contact closure provided on receive (which you don't need to worry about in this application).

I won't go into the "Monitor" switch found on commercial ("business radio") mics, since you don't seem to have that.

The audio can be wired straight through, so as to be on (or "hot") all the time. Or it can be routed through a set of switch contacts that close on transmit to complete the path. Or, it can be connected to a pair of switch contacts that short it to ground on receive. For balanced applications, usually PA and music, both wires are brought out as seperate conductors, either shielded or unshielded, and the frame ground is (usually) connected to the cable shield.

It gets even more complicated with some mics designed for CB radio use, but I doubt that is what you have. Bottom line, they pretty much all can be made to work on a ham rig with a little tinkering. The only real concern is whether the element is high or low impedance - Drakes require high impedance.

Jim, I did get your emails. Thank you very much for your help. It will help me to get the radio closer to completion and on the air. Hopefully no more smoke will leak out :-) I will keep everyone posted. It will be a big accomplishment for me as a newby and repair novice. Thanks very much again, Peter KC2RBX.

Hi Peter;

I am glad to be able to help you with the parts.

Just take your time and make sure that anything that is done is thought out well befor you put the power to it, then keep a cork or two handy to plug the magic smoke befor it gets out.lol

The 4 line that I have was non working when I got it many years ago, so I had to go thru everything. I did that about 5 years ago and had a friend stop by for a few nights and work the rig. I had it aligned about as well as it could be done so it works verry well.

I actually enjoy working on Drake and Collins radios, they are well built and can last a life time if taken care of.

I am actually old enough that I remember when the 4 line Drakes hit the stores in Dayton, Ohio and both my Father and Uncle wanted them really bad, but could not afford a set. Of courst they both wanted a KWM2 also.lol

Good luck with it and I hope to hear you on the air soon.

Jim.

Turner Plus 2 microphone...spec sheet says 5Kohm...that makes it "high impenence"? thus will work fine for Drake TR 4? If I don't run the audio too high...I can't find a diagram of the mic but I can take it apart and figure that out. If I do it wrong, I have a "smoke-e-tron" hihi. from what I gather 250 to 600 ohms is low impedence and that would make 5kohm a high...or am I asking a "stupid question"?

Enjoyed the learning lessons on mics, sometimes when the 4 acts up, I have to key the mic to work CW but that's in the manual so it must be a common problem with the VOX settings, I'll try the fix...My manual says that a foot keying switch may be necessary for proper CW operation, is that because the VOX setting for SSB and CW is different? Just asking the question...I'll try it and find out...tnx guys, very informative group...de HXB. DD

What is the best way to remove the aluminum inlay on the main tuning knob on a T-4xc?
Thanks
Wink WA8KOQ

I have drilled a small hole and pried it up from there. Much better than digging around the edges and tearing up an area that is visible.

Hi

For what it is worth I found out by accident. Just take the knob off and soak it in hot water (not boiling). As far as I know it is only cemented on (glued) which melts in hot water and then it nearly falls off. I was trying to clean all the ingrained dust off the knob and soaked it - very clean knob but aluminium fell off. Stuck it back on with a bit of impact glue.

Worked for me.

2783. PA1HFO Pin diode attenuator mod - TR7 digital board question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-17 15:42:05 UTC
From: floydsense
Topic: 2783 Message: 2783

This mod consists of a separate small board that inserts a PIN diode attenuator at the input of the PA brick and uses the decoded bandswitch position to provide a different bias to the PIN diodes for each band. I've been unable to get any further explanation on the band info from PA1HFO, but maybe someone familiar with that board will have an opinion on this.

One of the inputs to the TR7 Digital Control Board is a 4 bit BCD encoding of the bandswitch position, coming from the bandswitch. The board converts that to a one bit decimal representation of the switch position, with a different bit representing each position. That's the 8 bits I need to drive the attenuator board circuit. I guess one option is to take the outputs I need directly from U201, but not being familiar with design using these components, I don't know if there'd be enough drive there to not have a negative affect on the logic that follows that on the digital board. It may also be that the only signal output lines from the digital card (labeled synthesizer load number) could be used and those are conveniently accessible via the card pins on the bottom of the motherboard.

Can anyone offer guidance on this? Thanks.

Can't answer for the CW question.
Most microphones specify a source impedance. The Turner
in question has a built-in amplifier and was intended for
use with CB transmitters. The important thing is its output
voltage. While the Drake stuff was mostly made to operate
from high-impedance microphones with fairly high output
voltages the output of the amplifier may be too high without
some sort of attenuator. I can't find a spec sheet but if
you have one it should have this information. From what I
found it should have some internal adjustments.
All generator type microphones (crystal, moving coil,
ribbon, etc) are intended to be used into an open circuit,
the impedance being the source impedance. The low impedance
ones may require a step-up transformer to work into a tube
grid but still want to see a load impedance which is high
compared to their source impedance.

No, "high impedance" is usually in the area of 50 KOhms (50,000 Ohms) minimum. The +2 is an amplified mic, and the 5K is approximately the output impedance of the amplifier. It can be used over a wide range of load impedances due to the amplifier, low to high. Generally, amplified mics are not needed or recommended for Drakes, but if you are careful and keep the gain down, it should work fine and sound very good. And you won't let any smoke out if you get it wrong. It goes against my nature entirely, but I have been using a Turner +3 (later model with a bit of compression in the amplifier) with my TR-7/SP-75 combo lately because it has garnered stellar audio reports from some of the locals who know my voice and have suffered through my on-air mic comparison sessions.

IIRC, the +2 conforms to the old American "standard" of white=audio, red=PTT, black=PTT return, and shield=ground. There will probably be a switch on the bottom to change the configuration from "relay" to "electronic" switchng (a CB radio thing). This will change the behaviour of the red and black wires to make one grounded on receive and the other grounded on transmit. The "relay" conficuration is appropriate for our radios. It is not uncommon for the relay/electronic switch to be configured to break the PTT line so the mic can be used in VOX operation if desired.

Here's some info for you:

http://www.iw7ehc.altervista.org/downloads/microfoni/vintage/TurnerWiringBooklet.pdf

The first 12 pages contain some good general information on Turner mics, including the +2.

FWIW, I've tested the Turner 254HC, the non-amplified version of this particular family, on my TR-7 with excellent audio reports. If you wanted to go to the trouble, you could remove the amplifier from the circuit entirely, which would turn your +2 into essentially a 254HC. And save you a little money on batteries.

The +2 has an external gain control on the rear apron of the microphone base.
It has plenty of output to drive Drake gear, in fact overdrive of set too high.
Used properly, it should work jsut fine.

Thanks to Jim and Richard,,,I was almost positive it would present the Drake no problems. I think I might wait until I get a couple of mic plugs and not "de-wire" the one I have that is working. I've played with enough mics to never trust the "wiring diagram"...I can check the 4 schematics and I might as well go thru the Turner while I'm waiting, do a little house cleaning. It hasn't been used since I sold the 101 years ago.

And to answer my own question???? "The only stupid question is the one that wasn't asked" hihi.

Co-incentally, the CW question, I think, was answered in an earlier post,,,about the VOX adjustment being wrong, just haven't had time to play with that yet...Holidays....BAH HUMBUG, just another impediment to good radioing...but then again I might have a sticky relay but the mic works fine, just the CW part is a tad funny...Many thanks to Butch...this TR 4 is sure fun to play with.

That's a good policy, not necessarily because wiring diagrams can be wrong (they can), but also because well-used mics may have been rewired multiple times by people (who may or may not know what they are doing).

2789. My Drake Latest

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-18 15:15:45 UTC
From: Carl McLelland
Topic: 2789 Message: 2789

Good morning guys,
Thought I'd pass on the latest on how things are going. After letting both the transmitter and my 'lack of patience' cool for a full 24 hours, I went methodically through the manual and tuned up the trnasmitter. When I got to CW, I held the key and got a good signal to the dummy load. I was showing aobut 130 watts output on the meter. For the mike, I ultimately wired up the Astatic hand mike. I wasn't satisfied with the ElectroVoice mike, and the Astatic seems to spec out correctly. I can't whissle, so I had to do the old "test one two three" into the mike, and I was getting a good 'bounce' on the meter, so I would say (1) the mike is working and (2) the transmitter is working. I've cranked the VOX all the way down as recommended in emails, and it appears that feature is out of my life for the time being. I'm getting closer.....

With the mike keyed, unless the (receiver) gain is turned all the way down, I get a terrible squeel from the receiver. My understanding was the transmitter was supposed to cut off the (receiver or speaker, don't know which), and this apparently isn't happening. Any ideas?

This morning, as usual I went out to the shop for a bit of "Audio Voyeurism". Now the highest band antenna I've got right now is a 20 meter dipole, so I couldn't transmit anyway, but I was receiving someone calling a CQ on 3.985, the QRP hailing freq. Admittedly, I couldn't catch his callsign so he may have been 'up the street', but the quality and quantity of reception across the bands tells me the receiver is working very well. (Note: this is with the receiver turned on, antenna plugged into the MN-2000 then transmitter, and the transmitter OFF).

OK, I wanted to check out one more feature... I turned on the transmitter to SSB. I immediately noted a drop in reception on the receiver, but I was still receiving. (The switch on the transmitter for selecting receiver or transmitter tuning was in the receiver mode).

Next I tried to tune in the same band on the transmitter that I had on the receiver. All I had was the electronic 'hum' noises you always here, but no incoming signal or noise to peak the frequency band. I thought this odd, so I went back to 'receiver' tuner selection and searched until I found a particularly loud side tone to try and "find" on the transmitter side... Switched back to transmitter (frequency) selection and nothing. Could not find it, couldn't peak the frequency band, couldn't hear ANYTHING except the usual hum of the radio.

Am I doing something wrong, or is there a problem with the transmitter? Have I even presented enough information to debug?

I'm starting to remind myself of my wife..... "There's something wrong with the car". "What is it doing?" "It makes this funny noise". "Please describe that funny noise. Was the car moving or stopped when it did it?" "You know, a funny noise... THAT funny noise". And so on.....

To think they refer to these things as "boat anchors"..... Just think, I've got a boat, too! (And I already carry two Danforth anchors on it, don't need another one).
73's around, and Merry Christmas.....

Sounds like some mixed results, at least it has pwr out.

Pardon me for being so dense but this has been a long & (to me) confusing thread + my Windows Explorer has gone belly up so I'm getting all this from a web based browser that I'm not used to.....

What model Drake r u using ? This is the one that has been setting for yrs right ???

When I buy an old radio of unknown condition the FIRST thing I do before ever turning it on is to take it out of the case & thoroughly clean all the switches w/ a gud spray cleaner. DeOxit is the best but Radio Shack works. I prefer a non lube type but sometimes that will make the switches a little hard to work. I spray down the chassis & the tube sockets (non lube type only) & rock all the tubes a little. In the process u can look everything over closely. Look for any obvious broken wires, bad solder joints & especially for previous user modifications. Hams love to fix stuff better than it came from the factory BUT not all of them really know what they're doing ! I know that's hard to believe.....

See if the power cord is gud, U may want to put a new 3 wire plug on it. Carefully clean the relays if it has any. If u find something loose or obviously messed up address the problem. Generally it's all OK but u don't know for sure & cleaning the switches & working them all vigorously often saves u from a lot of scratchy, intermittent performance.

As for the issues ur now having.....I gotta think abt that for awhile, I'm not thru my first cuppacoffee yet.

Top o the day to u,
Butch

The receiver FUNCTION switch must NOT be in the ON position for the transmitter to MUTE the receiver, it must be in EXT MUTE, NB, or CAL. Obviously the MUTE cable must be connected between the two, or a shorted plug in the receiver MUTE jack, or the receiver won't operate in these three positions.

For the receiver to work "through" the transmitter, there must be a cable between the RCVR ANT on the transmitter to the ANT jack on the receiver.

When using the TRANSCEIVE function in XMTR, the INJ cable must be connected between the two units as well. If it's a C Line, there must also be a cable between the CAR OSC and CARRIER OSC jacks on the transmitter and receiver respectively.

Good morning Butch,
Drake R-4C, T-4XC, MN-2000 and MS-4.

Before I fired anything off I removed the covers, lightly blew out the dust and spider webs, etc, "wiggled everything", pulled and wrote down all the tube numbers, etc. I didn't use contact cleaner on it like you recommend; but I'll do that next times the covers are off. Power cord: I was thinking about that because the present cords are not three way grounded plugs. Also, I made a "grounding manifold" out of flat copper strip with a flat strip to each chassis. That goes to a 42" grounding rod driven through the concrete at my feet, so I've grounded the system about as good as humanly possible.

The email that followed your has several things to check; which I will do shortly.

Oh, everything is wired and/or cabled methodically according to the manuals. There's an old saying: "If it ain't broke, don't fix it"..... The next line reads "If you don't know what your doing, follow directions and leave it alone!" I follow both axioms..

I know little abt twins or how to set them up. Someone else gave u that info recently tho. Without the cleaner I doubt that u acomplished much but maybe u didn't have a problem.

U drove a 48' rod into concrete..... u must be tuff ! ! Having the ground buss is a gud idea. Everything should tie to it w/ a seperate heavy wire.

Gud ground systems have hundrerds of ft of 4/0 wire. I have abt a dozen 8' ground rods & something like 300' of 4/0 + part of it's laid in a trench that I periodically treat w/ epsom salts to improve conductivity. Helps w/ end fed wires & on 160m. Stick to a dipole & it doesn't matter that much.

Keep us informed.

Well the TR4 got here Saturday and is in good shape.
Put it on a veriac and brought it up slowly.

Started checking it out and have found severial problems.
First, "S" meter stays all the way to the right and very low receice audio into head phones. Lamp fuse is ok. (in to antenna receiver/transcver switch in Transceive. I did check V17 with my tester and shows good tube no shorts. However the tube is not very tight in the socket. Socket looks good and I tried to tighten up pin holders and that did help with tube fitting but did nothing to receive signal.
I did not check C135 on V17.

Second, one bad final and no output. I peaked RF tune to max noise and tried to dip plate with no luck.(into dummy load)That is when I noticed the bad final.

On the relay R1, I only see one set of contacts and they are switching to ground in transmit and so that is not the set for receive/transmit.
Can anyone tell me where the other two set of contacts are?

I will forget about transmiter and work on receive first.

Right now I have too may projects going. Building homebrew legal limit amp, have an amp on the bench to repair for a friend, and a RS50M ps apart to repair. The Drake is last on the list sad to say.
Thanks for reading. I will keep all up as time goes on.
73,
Don, W5KG

Good morning guys,
I reached a conclusion with my Drake gear. I'm going to put it on the back burner until I've learned something about electronics and can restore the gear right and have it work according to specs. I look forward to 'vintage' Ham, and one day this gear will breathe new life onto the airwaves.

In the interim I've ordered a new Icom transceiver and antenna so I can get up-n-running and enjoy this new hobby.

I'll likely be more of a 'lurker' than active participant on the site for a while until I actually start working on that T-4XC.

Besides wishing everybody a Merry Christmas and Happy New Year I also wanted to express a hearty Thanks to all of you who listened to my questions and offered solutions to the problems I was encountering. And thanks especially to my good friend Kenny (K6UKZ) who not only gave me the gear but motivated me to get into the hobby.
73's around....
Carl

Sorry it hasn't worked out for the moment. I understand well how u can only take so much at a time. It could still be something fairly simple, keep ur ears open & if u run into some local old salt u might have them take a look at it just for chuckles & grins.

U might also consider sending it to someone who specializes in the repair / restoration of Drake gear. I don't know of anyone personally but I'm sure someone on this list could give u a reference should u decide to do that.

In 1980 I bought a used Knwd 520S, my first rig & it's still in operation. Thru the yrs NUMEROUS boatanchors have passed thru my hands. Some worked, most needed work. They were fun to play w/ for a while & then they mostly went away. As long as u have a gud, dependable radio to keep u on the air it's a whole lot easier & less frustrating to deal w/ the neat old "junk" that comes ur way from time to time.

Sounds like u have a gud plan, hope to hear u "on down the coax".

Good afternoon Carl,

Sometimes a little back burner time will help keep the project warm. Place the "hollow state" handy right next to the solid state so that you can give it TLC and a poke now and then. Inspiration will strike when you least expect it.

ALSO Merry Christmas to all and may the new year bring health and happiness and resonance to all.

K1 is in the final cage just in front of the antenna connector. First I would clean tube pins and switch contacts. Then tighten the little screws that hold the circuit cards and tube sockets to the chassis. Many of the screws are ground connections and corrosion makes the connections intermittent.

Thanks Larry, I had found the K1 relay after I removed the RF cage.HI I sprayed a little de-ox in and cleaned a little bit. Reset the finals. Cleaned the pots and switches. I "wiggled" the 12by7 and reciever started working with good audio.
I will check all screws tomorrow.
Again thanks for not thinking I an a dummy for not finding the relay. A blind squirrel finds a nut every now and then.

The contact with the wiper grounded IS the T/R control. Grounds several transmitter stages in T and several receive stages in R.

> Can anyone tell me where the other two set of contacts are?

From: Carl McLelland
Topic: 2809 Message: 2809

Morning Guys!!
May Santa bring us the 'perfect' supply of sunspots and atmospheric heating this coming year!! UPS' tracking says the new radio should arrive today... Can hardly wait.

Question regarding Drake gear....

With the R-4C, T-4XC, MN-2000 (which I will use with the new Icom) and MS-4, I also got a Drake TC-2 "Transmitting Converter" and a Drake CC-1 "Converting Console". There weren't any cables that came with them and I don't think Kenny ever used them. Probably aquired them 'along the way' but never connected them up. They appear used (probably got them second hand) but appear in really great shape.

Can anybody (in 25 words or less... or more if necessary) explain what these two pieces of gear are used for?

OK, that takes care of "today's question".

Was listening to the bands this morning and picked up the weather forecast for the Bahama's on 40 meters! Just in time to turn the TV on and get the local weather forecast. With a high pressure building, those of us in Northern NEvada can look forward to more sub zero lows..... I think I'm ready to try out that "Bahama forecast!".

73's to all and a Merry Christmas.
Carl KF7GJO

From: Garey Barrell
Topic: 2809 Message: 2810

Hi Carl -

The CC-1 is just the cabinet! The "internals" should be a power supply/calibrator, two meter receiving converter, and possibly a six meter and "EXTRA" receiving converter.

The TC-2 is a 2M transmitting converter.

MANY cables are required to set these up, which may be why "they were never used"!

Any of the T-4X(any) or TR-4(any) must be modified (easy) to use the TC-2. IF your T-4XC transmitter has been modified, there will be three extra RCA phono jacks on the rear panel, two in the center (unlabeled or marked "A" and "B") and one on the right end of the rear panel (unlabeled or marked "EXC OUT").

I don't think I made the "25 word limit", but ...

Merry Christmas!

Hi Carl,
Like you, I have been lurking and gleaning info off here for some time now. Don't have the technical knowledge or experience to contribute. I have been watching, copying and catagorizing everything I can about fixes and troubleshooting to help me learn.

Never was a very good book learner. Hands-on practical experience, mine or observing others, always drives things home better for me. But keeping track of this and the other Drakelist has really inspired me to study the electronics at a level higher than required for my General ticket. Picked up the Extra Class study book. I have to confess that part is going pretty slow. =)

Have several Drake rigs, for historical reasons and to learn from as well. Haven't touched the ones that need work yet either except for tuning and tubes but seeing the progression from model to model has been a very interesting history lesson.

Thanks everyone on the group. Especially those who ask questions. =)
Its been like having a elmer throwing you lessons to grow on on a regular basis.

Merry Christmas all. Safe travels and joyful times.

God bless

2812. TR-4 on the air

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-23 15:47:46 UTC
From: w5kg
Topic: 2812 Message: 2812

After doing all that was suggested. I made sure all ground screws were tight and clean. I pulled all tubes and reset them. I cleaned with de-oxit all relays, switched, pots. Then I checked and set the bias and after that I put the rig on the air.

On transmit the out put is about 130w on 75 meters. I will check on other bands today.

The receiver is a very good one. This is the first Drake I have owned and I like the receiver better than some of the Kenwood TS820's I have had over the years.

I may send it off to have it re-alined at some point. However I am going to use as is for a while to make sure all else is ok.

As far as the other AC3 ps I have, I put it on my variac yesterday and I will give it a test today sometime.

I would like to thank all who made suggestions and helped in getting this rig back on the air.

So let me wish everyone a very Merry Christmas and Happy Holidays.

Dr Hajo,

have a look at
http://www.mods.dk/manual.php?brand=drake
Note: You can download only one manual per 4 days.

2816. R4 S/N Question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-23 23:24:37 UTC
From: Dave
Topic: 2816 Message: 2816

I have an R4 with a S/N of 1419 and am wondering if that puts it as being manufactured in 1964? WB4HFN's serial number database only lists R4A's starting at year 1965. Does anyone have one they bought new that could tell me or were they all made in 1964 before they came out with the R4A?
Thanks in advance and very Merry Christmas to all the list and thanks for all the help this year.

2817. TR-& Questions

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-24 03:26:43 UTC
From: captcurt2000
Topic: 2817 Message: 2817

Good Evening All and Happy Holidays:

Getting an early TR7 sorted out here. Have a couple of questions.

Are there any differences in the service manual versions? My TR7 is Ser 1786..so late 78. The Service manual I have that came with the TR is dated OCtober 1980 and says printed with revisions. I've noticed a couple of minor differences in the look of a couple of boards.

Unit seems to work after a fashion. WHen rcvd, the 10V adjustment was sitting 1t 9.77 and the passbands and rx/tx freqs were obviously off. So I bit the bullet and went thru the whole process.

Also noticed that the ALC light stayed on all the time..this has now changed and the ALC comes on at key down and then gradually dies out after a few seconds in CW. IS this normal? Bright lit at start then dim and then out.

Also, The unit is tripping the PS-7 over-current protection at about 100W showing on the internal meter. I watched the 13.6V incoming and it drops to about 13.3 at 100W. Haven't actually monitored the current but will do that next.

In SSB, the over-current in the PS-7 trips immediately, perhaps one increment of the mic gain control and no ALC showing at all--just trips.

Other than this, the unit works.

What is the secret to the way the board pins are numbered? ie the 5645 BFO freq is to be monitored from pin 40 of the PBT board according to the service manual--there are only 31 pins..?

This unit is well equipped with three optional filters, AUX-7 board for WARC/MARS, NB, and DR.

Thanks for any insights. I'm sure I'll find more.

Welcome to the world of TR-7 (otherwise known as TR-&), Curt! Comments inserted below.

On Thu, 24 Dec 2009 03:26:43 -0000, captcurt2000 wrote:

>Are there any differences in the service manual versions? My TR7 is Ser 1786..so late 78. The Service manual I have that came with the TR is dated OCtober 1980 and says printed with revisions. I've noticed a couple of minor differences in the look of a couple of boards.

There were several minor revisions, and one major revision, to the 2nd IF/Audio board. The major revision being a redesign of the product detector. The revisions may or may not be reflected in your manual copy. There is some debate as to whether the version 2 board is really more deirable to have in practice, or not. Some details on the minor revisions can be found on my page at:

http://radiojim.exofire.net/pages/TR7_2IFA.html

The factory changes to later version 1 boards are desirable, and should be made if you don't have them.

The TX predriver board was also completely redesigned, with the version 2 predriver board being an improvement. Having said that, if you have a version 1 predriver and it seems to be working fine, don't worry about it. You're one of the lucky ones. If your radio has ever been to Drake for service in it's lifetime, it was probably upgraded to the version 2 predriver.

>Also noticed that the ALC light stayed on all the time..this has now changed and the ALC comes on at key down and then gradually dies out after a few seconds in CW. IS this normal? Bright lit at start then dim and then out.

The ALC light should stay on, if you increase carrier level until you are into ALC. (Note, for cleanest CW signal, you should normally operate just below ALC). Are you noticing any falloff in power output? If so, you may have a problem in the PA deck. Possibly bad predriver or driver transistors. Refer to the DrakeMods document for version 2 predriver overheating issues (did I say version 2 was an improvement?). If you get decent power output at all, your PA transitors are probably good. There is a nice article on wb4hfn.com on reworking the TR-7 PA deck to resolve power falloff, predriver overheating, and low power on 10 Meters issues. Also, see my comments on the Drakelist online forum on rebuilding my own PA deck based on the article on wb4hfn.com.

Assuming the PA deck is OK, you may have a problem in the ALC circuit or the wattmeter circuit (where the ALC gets it's control signal from). It's a pretty simple circuit, really, and should be easy to troubleshoot. The W2VJN ALC mod, published by GW4ALG at http://www.alg.myzen.co.uk/radio/tr7/mods.htm#18 , is worthwhile to apply while you are there (afrer it is working properly, of course). Some people like to point to the PIN diodes in the T/R switching as

the root of many evils, so you might want to check them as well. Refer again to wb4hfn.com for testing info.

>Also, The unit is tripping the PS-7 over-current protection at about 100W showing on the internal meter. I watched the 13.6V incoming and it drops to about 13.3 at 100W. Haven't actually monitored the current but will do that next.

Where are you measuring at, internal to the radio or in the PS-7? If in the radio, you could have dirty or worn connections in the Jones plug on the end of the cable. Another possibility is the main filter caps, or dirty edge connections on the regulator board. GW4ALG also has a nice writeup on PS-7 problems, here: http://www.alg.myzen.co.uk/radio/tr7/mods.htm#16 . The whole GW4ALG page is recommended reading, as are the many articles at wb4hfn.com.

>In SSB, the over-current in the PS-7 trips immediately, perhaps one increment of the mic gain control and no ALC showing at all--just trips.

I would suggest cleaning the adjustment post in the PS-7, and resetting them. A lot of dirt can get drawn in over the years. A fan is also recommended on the PS-7; it's job appears to be not so much to cool the heatsinks and transistors, but rather the main filter caps. An oft-neglected point is that capacitors get hot too.

>What is the secret to the way the board pins are numbered? ie the 5645 BFO freq is to be monitored from pin 40 of the PBT board according to the service manual--there are only 31 pins..?

It's confusing. I have to figure it out all over again whenever I do one. Some of the points are labelled on the bottom of the board, and once you find one, use it as a reference to find the others. IIRC the BFO is at or near one end, and is marked. A couple of the critical RF points have coax connecting to them, so they are easy to spot. To make it easier, once I found the correct points, i labelled hem with a fine point Sharpie and soldered small loops of wire in place for test points in my radio. At least one of the points, IIRC, has a fairly low level signal and requires a sensitive frequency counter to measure. I also found that counter loading can be miminized by measuring through a resistor of 200 to 500 Ohms - YMMV.

>This unit is well equipped with three optional filters, AUX-7 board for WARC/MARS, NB, and DR.

Nice score. Keep it!

Jim covered most all your questions.

The Pins on the TR-7 boards are numbered per the parent board. If the unit is upside down, front panel toward you, the pins are numbered 1 - 40 from right to left. ALL pin locations are counted, even blanks.

So Pin 40 of the PBT board is the last terminal, closest to the left side as described above.

Date: 2009-12-24 18:36:23 UTC
From: captcurt2000
Topic: 2817 Message: 2824

Thanks Jim for the links and all..just what I needed as I get "institutionalized" into the TR-7. And thanks Garey..that was one of the schemes I suspected but have not found a single thing in official print about the pin numbering.

There are no numbers or other notations on this parent board--

I cleaned up the PS7 a bit this AM and found the large diode stud mount to the floor loose. This fixed the instant trips on SSB. I've adjusted the current pot up somewhat and it will run now continuously at 100W. (I'm so not used to monitoring ALC)

The main filter caps in the PS have that "little Debbie" smell but I see no evidence of venting or leakage, it is quite apparent--so I will replace the two filters.

Want to try the HFN method for setting the passband voltages/frequencies since I had a difficult time getting stable readings on my HP counter at the 5645 point.

Now that the PS is holding better, I can redo the ALC settings also. Light still comes on bright at key-up and then slowly reduces to be off or reflect the voice peak as it should.

I like the way this rig sounds--need a DR7 Jumper board, and a set of extenders and I'm sure it is close to healthy. Next is an RV-7 so I can work split.

Still have a pair of B twins and a TR3 to get going also. Too much hobby--not enough time!

Merry Christmas and Happy Holidays to All.

2832. Distorted Audio

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-26 18:17:24 UTC
From: drakesforu
Topic: 2832 Message: 2832

Suddenly my R-4B has distorted audio. At first I thought it may be overload so I cut back on the RF Gain but the distortion is still there even with S5 ssb signals and the cw notes just don't sound crisp. There is a raspy sound to it even when adjusting the passband which has no effect on the quality. I want to say this but then I don't think its accurate but it is like the AVC is off and the receiver is being overdriven. Tube?
Thanks.

john

John -

Check the voltages on the 6EH5 AF OUTPUT tube. Possibly cathode
resistor gone up in value. Also possible dried up electrolytic that is
used to decouple the low voltage supply to the AF PREAMP stage.

Garey,
V7 6EH5 voltages check out Except for pin 1 which is supposed to have 4.5V dc and I am showing zero.

OK. Sounds like the electrolytic, (C176?) from Pin 1 to ground is
shorted. That would do it!. May also have a bad 6EH5 if it's been run
that way too long.

2839. Microfone for TR-7

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-27 18:13:42 UTC
From: Hans-Joachim Empel
Topic: 2839 Message: 2839

Hello Folks ,
i was looking for an original Desktop - microfone from Drake , but its not easy to find and if there is one available its modified for Japenese rigs (they are using low impedance mics.)

The price for an original one is for me too expensive or i have to rebuild the mike to the original.

in my sparpart box i found a microfone from the american Manufactorer Rauland .

Its a Rauland Type 1294 Desktop Mike.

On the Metall Bottom Plate i found following : Modell No.877HL THE ASTATIC CORP. Conneaut OHIO USA

The Mike looks like the original DRAKE Mike : DRAKE 7077 Dynnamic.

Has anybody of the experianced TR - 7 Operators any Idear ore Experiance with this mike.

I tooked also in the atachment the pdf - file for this kind of Rauland Mike.

Thanks for any Information and Help for a Drake TR - 7 Newcomer.

Kind regards from Germany

Joachim

Joachim,

I should think it would work fine. I believe the 7077 is simply a high-impedance only version of that microphone. You will probably want to use it in high imedance mode, and you may need to connect it to the high level input pin on the TR-7 mic connector. I don't know which pin mine uses, but I can check. It has only been used with a TR-7 throughout it's life, so it should be 100% original. It should have a very good, natural sound to it. I found that my 7077 works very well for casual operating and rag chewing, although it seems that some of the ceramic mics that I have are more suitable for DXing and contesting. Note that you may need to modify the wiring internally so the element is "on" all the time if you like to operate VOX.

John -

Cool!

The AF OUT stage is operated in Class A. This means that the tube should be biased to about the middle of the linear portion of it's range. With the cathode biased at 4.5V and the grid near 0V, the grid is effectively biased 4.5V negative in relation to the cathode, limiting the plate current of the tube to the proper level. With the cathode at 0V, the tube is essentially "turned on hard", with the only limiting factor the primary DC resistance of the output transformer and R43. It would be a good idea to check R43 to be sure it has not been damaged by overload.

With C176 out of the circuit, the AF output power is divided between the output transformer and R44. When C176 is added, it bypasses the audio signal across R44 so ALL the AF goes to the output transformer. The value of C176 also affects the frequency response of the amplifier somewhat, because as the capacitive reactance goes up with decreasing frequency it reduces the bypass effect, so the low frequency response rolls off.

Don 't forget that all TR-7s will work with either hi or lo impedance microphones.!

Early units needed a resistor jumpered in or out internally. Later models just used one of the four microphone plug leads for hi and another for lo. I'm away from home and don't have my reference material so can't specify which pin is which, but it is in the Operator's Manual.

2846. Re: [DrakeRadio] Microfone for TR-7

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-27 23:21:15 UTC
From: Jim Shorney
Topic: 2839 Message: 2846

The way I have always understood it, the choices were: pin 1 - high impedance, or pin 4 - (with the 470K added to the back side of the mic jack in all but the earliest production units) high level high impedance. The 680 Ohm resistor on the TX Exciter board was a user option that had to be jumpered in to use low impedance mics. My service manual seems to confirm this, in fact stating that the jumper is "not installed at the factory" and is "seldom required for proper operation". Looking at the TX Exciter board schematic, the first thing that the mic sees (after the dangling 680 Ohm resistor) is 150K in series.

This edition of the service manual is an original 1978, and is marked as having accompanied TR-7 serial #8680. I have a later revision (copy) downstairs in the lab, will check it later.

Hi Joachim,
use the controls for CARRIER and MIC GAIN.
The ALC won´t operate at lower output levels, but that´s not nesessary
Or is there another problem?

Been an owwner of a R4a and T4x combo since the mid 60's use them nearly every day still.

When mine was new, I also operated a school club station with a collins S line. During contests, we had the opportunity to use these rigs side by side--The Drakes were easily the equal of the S lines in every way--in some ways, they were better. (I thought they had a better tuning "feel". In my opinion, they are not mechanically built as well--BIG cost difference after all.. but performance wise, they are the best of the best. I dare say, they are in a different league than the Heath units but never actually had the chance to use those in side by side.

The specs never tell the entire story, only intensive use over a period of time will bring out the best and worst in a rig.

Hi Tyrone,

Lots of opinions here:

http://www.eham.net/forums/Elmers/178388

Someone who has actually done it, here:

http://www.pa6z.nl/PROJECTS/L4B_160_MOD/body_l4b_160_mod.html

I once read of a "trick", but have never tried it. Basically, you use an external L-Network antenna tuner to suppliment the internal tank circuit in the amp. Leave the load capacitor in the amp at minimum capacitance, and the inductor and the variable capacitor in the tuner become the "rest" of the tank circuit for 160. I have no idea if this would even work, let alone how well or how it would affect RX, but it's an interesting idea.

2853. Drake ps7 power supply wiring information

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-28 19:45:21 UTC
From: alex7younger
Topic: 2853 Message: 2853

Can anyone please tell me the correct wiring for the Drake ps7 10 pin lead after it enters the ps7 chassis. The leads have been cut off by a previous owner and I`m trying to reconnect them.I have a circuit diagram but it seems to relate to a newer model of ps7 than the one I own which has the number 2000 and i know they go up to at least 9000 by which time they appear to be quite a bit different inside.
the colours of the leads are :6 in number
1 black, 2 yellow, and 3 orange, thin wires
4 white screened.
5 black, and 6 white, thick wires I think these are the power wires
Some of the wires I can possibly work out but I`m especially interested in where to solder the black and white power wires
Any help would be greatly appreciated
many thanks in advance and 73`s

The two versions are electrically identical, the earlier version used point-to-point wiring whereas the later version consolidated much of the internal wiring onto a printed circuit board mounted to the rear panel. Thery are pictures of both versions in DL7MAJ's article on inrush current that may or may not be helpful to you:

http://www.dl7maj.de/PS7-Inrush.pdf

In any case, I wouuld verify the wire colors with an ohmmeter before you plug in. Color codes can vary in undocumented ways, and you could let some smoke out if there is an error.

From: drakesforu
Topic: 2856 Message: 2856

Was at the Target Store the other night and tried on Bose Around the Ear headphones. These are the most comfortable headphones. They are light, do not feel like vise grips after 5 minutes, and the sound is fantastic. I had them on for 20 minutes and was never uncomfortable.

I did not notice the impedance but the Drake R-4B requires a 600 ohm headphone. If I do decide to purchase the Bose what is required to increase the impedance?

It seems that the Bose web site is devoid of any real technical information, including impedance. You will probably need to contact them and ask. The Best Buy web site says 32 ohms. Assmuming this is correct, this will be halved because you will be using them in mono, with both sides in parallel. You could try a 560 Ohm resistor in series with the phones, but you probably won't get enough level that way. What you need is a 16-to-600 ohm matching transformer. Or, take an old stereo amp that has a headphone jack and drive it with the headphone output of the R-4B, loaded with a 560 Ohm resistor. That should give you plenty of gain. It doesn't need to be a big amp, a few watts will do. Radio SHack used to sell various mini stereo amps, such as the SA-155, that would work well.

The schematic shows the headphone jack is paralleled
with the speaker jack with a contact that shuts off the
speaker when phones are connected. I doubt if the AF amp is
very sensitive to the impedance connected to it unless it
needs some mimimum load to prevent transformer problems,
which would be unusual. It should drive any impedance phones
provided there is enough voltage. I just tried mine with a
pair of cheap HI-FI phones with 20 ohm impedance when
connected for mono and a pair of old Western Electric 20,000
magnetic phones and got good levels on both.

2861. 1.8 KHz SSB - Filter

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-29 10:19:14 UTC
From: Hans-Joachim Empel
Topic: 2861 Message: 2861

Hello Folks ,
again a small Question,
i can buy a DRAKE 1.8KHz SSB - Fiter for my DRAKE TR-7.

Question : how good ist the SSB - reception with this filter ????

If its a good improvement , i will buy the filter .

Please let me know if this investment is usefull.

Regards
Joachim

Hi dear Joachim,
I´ve installed these filters in my TR7 and R7.
They are not very useful, because the smaller bandwidth reduces interference - but also readability of the wanted signal.
Of course there are situations possible, where these filters help.
A good tuneable Audiofilter can also help like the 1,8kHz-filter.
The PBT and the 2.4kHz-filter are in general sufficient.
On the other hand, it´s a question of better feeling, when these filters are installed.....

2863. Drake RF Cables

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-29 12:45:56 UTC
From: Richard Hanna
Topic: 2863 Message: 2863

I recently bought the "stuff" to make a set of the RF cables for my Twins. I bought enough to make a couple extra sets, so I want to offer them to the list members.

I have 1 set available, which consists of two low capacitance (RG-59) cables 3 feet long (for the PTO/VFO Injection), and 1 RF (RG-58) cable also 3 feet long. These are made using all metal high quality phono connectors and work very well with clearance when used on adjacent sockets.

I would like to get $30 for the set which will include shipping within the US.

If you are interested, email me, and I will work with the first emailer to arrange payment. I do have a paypal account, and will accept a postal money order. Also will accept a personal check but will wait for it to clear. Do NOT send money till we have made arrangements!

If you are interested, please email me direct.

John -

Matched AF output loads are required for maximum power transfer.
Driving a high impedance load from a low impedance source is only a
problem if you want highest efficiency. Since phones are considerably
more efficient transducers than speakers, you don't NEED all that power.

One problem that does arise with low impedance phones, (typical 8 ohm
"hi-fi" phones,) is that only a very low output is required to drive
them. This results in the AF GAIN being so low that the AF Output
stages, which run wide open, (GAIN is controlled by reducing the amount
of AF applied to the stages input,) means that the s/n ratio is not very
good. This results in poor, noisy audio, particularly hum, which is
made even worse by the often accentuated low frequency response of those
types of phones. Whew!!

This is why Drake recommended 600 ohm phones. These require a higher
voltage for a given sound level, meaning the AF GAIN control needs to
be higher, better s/n ratio.

You can try the BOSE phones, and if the AF GAIN control is too low, put
a resistor in series with the phones, either in the plug or an external
adapter until the s/n ratio is satisfactory.

From: Kris Merschrod
Topic: 2856 Message: 2866

I've resisted commenting, b/c my approach headphones has been primitive. Using an adapter 1/4" mono to stereo adaptor and then a 1/4"to 1/8 adaptor I just plug any old stereo headsets into the R-4any and TR-4any rigs. They range from the junk they hand out on planes (including a PAN-AM set going way back) , to R-shack with and with out those little volume controls (resistors in series), to Heil, to no-brand types and they all work to my listening enjoyment.

There does not seem to be any damage done in this way. I've also plugged them into the speak jacks (the Drake speakers are supposed to be 4 ohm - I've also plugged in 8 oHM 3-way speakers). All sound and no smoke - cw, ssb and AM. There is probably a audi fine point that I am missing, but if the headset fits, then wear it :>)

Have a Happy New Year celebration and my the new year be a healthy one for all (and their rigs).

John,

You can also wire up an adapter cable that puts the two transducers in the headphones in series, giving you a higher impedance. When I used stereo headphones with an old Ten-Tec rig, I found I needed a series resistor to reduce the volume to a level at my ears that corresponded to listening to the speaker at a given position of the AF gain control because of the high efficiency of the phones. So experiment. I'm sure you'll find a method that works.

Just some general comments about audio bandwidth in speech communication: Bell Telephone Laboratories did extensive research about this beginning perhaps as early as the 1920s and continuing for as long as it existed. What the telephone company found was that most of the _power_ in speech was in frequencies below about 300hz but that the intellegence was mostly in the frequencies between about 1000hz and 3000hz. For band limited systems about a 2khz bandwidth is sufficient for intelligible speech but they also found that it was necessary to include frequencies down to about 250hz for naturalness. Subscribers did not like the sound of sysems with more limited low frequencies. For its carrier and long distance radio transmissions Bell System decided on a range from 250Hz to 2750Hz, a 2.5Khz bandwidth. This was a compromise between economical use of bandwidth and preserving both naturalness and intelligibility. Speech which must operate with relatively high noise levels benefit from narrowing the bandwidth to the minimum needed for intelligibility so that the power avilable for transmission can be used for it rather than for the low frequency components in speech. Of course, the use of compression schemes which increase the average power of speech also help. The peak to average ratio in unprocessed speech is quite high so reducing it has a distinct advantage for noisy circuits. However, research done around the late

1940's by Licklidder and others showed that while infinite peak clipping improved speech intelligibility under noisy conditions it actually made it worse for quiet circuits. There was research done in Russia which showed that speech would remain intelligible even when processing and band limiting was so extreme that it was no longer possible to identify the individual speaker.
The 2.4Khz bandwidth used by Drake for both transmitting and receiving seems to be about the minimum that is practical. Wider bandwidth improves naturalness but not intelligibility under noisy conditions, which is the most common condition in amateur radio.
I can probably come up with citations but would have to do some research myself to find all the papers. I no longer remember the sources in detail. Those who have time to spend should look at the indices of _The Bell Telephone Laboratories Jounal_ and _The Journal of the Acoustical Society of America_ both of which contain a very large literature about speech and its transmission.

Joachim,

If you work contests, DXing, or crowded band conditions, you will come to love the 1.8 KHz filter in conjunction with the passband tuning and RF gain controls. For casual rag chewing, it's not a big deal. When I recently acquired a nice R-7A, I immediatly located a 1.8 filter for it because it just sounded "too wide" compared to the way I usually operate my TR-7. I now find it difficult at times to operate ANY radio that does not have a narrow SSB filter.

Just my opinion.

2873. Stacking Units

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2009-12-30 00:26:39 UTC
From: randyinaura
Topic: 2873 Message: 2873

I must have had some spare time today, and so I went to the "Photos" section of the Drake Group just to admire the various shacks of some of the group members. Now for my stupid question. I couldn't help notice that many of the members have their Drake equipment stacked one on top of another. Some even stack units three high! I'm sure the engineers at R.L. Drake put all those holes in the top of the units with the idea of doing more than saving weight. Isn't the cooling of the units affected when their stacked that way? I have a T-4X and an R-4A. Is it okay to stack them? Which unit should go on top? Thanks in advance for any suggestions.

Hi,
Just picked up a Drake TR-4 at a Ham Swap for almost nothing. Plugged it in and it looks like it is OK. So far I was just able to check in CW. My question is what kind of MIC can I use with this radio. I understand it is a high impedance input. (I guess around 10 kilo Ohm), is this correct?

Thanks,
Udo (KF4KUL)

2875. Re: [DrakeRadio] Stacking Units

Stacking is an old custom that is the civilian counterpart to military rack mounting. This all dates back to the PTO era (pre toaster oven) which WAY,WAY predates the microwave oven.

What u can't tell from these pics is that just before the exposure was made the proud owner had straihghtened up the shack, discarding the aluminum foil & little pizza trays that had been left on top the rigs after warming snacks & light lunches.

Different strokes.....

b

PS. I hear the Icom 7000 is pretty gud for warming Honey Buns or other small rolls....certainly can't compete w/ a REAL radio tho.

If I were to stack them and at times I have I would put the transmitter on the top, open to allow it to breath. The transmitter will create the most heat. I've wondered about this too, not just with Drake but other gear.Even without holes on the top, covering the top will create more heat due to the chassis metal or material not being able to breath. So although space may require this, it may not be a good or at least the best approach.

Thanks to those who answered my original post. Okay, let's assume that stacking rigs is, if not bad practice, at least bad form. It is, however a matter of degree (no pun intended), rather than one of principal. Imagine if you had one rig on the floor and the other up near the ceiling - no problem, right? What if the two units were separated by several feet - still no problem. So, the question now becomes, what is minimum distance one should consider separating the units by, if they're being used, one on top of another?

Just about any Hi-Z mic eill work well.
On my TR4 I am using a Shure mic with very good results. Having said that a Heath/Electrovoice, D-104, Or any mic that has a high impedance element in it. Even a Kenwood MC50 will work very well.
Take your pick.

I find that using the passband tuning, I can very often improve the readability of a signal with the 1.8 filter under adverse conditions. They key is the passband tuning. I run with it on all the time, it is one of the most useful tools.

Drake use to make a CA-1, a stacking cabinet for stacking the 4 line. Below are three links showing it. Although we can all agree that heat or too much heat can be a bad thing the question is at what point do we reach that level.

One of my friends suggested it was a bad "pin diode". If so, on what board is this diode or is it on the motherboard? I would like to get this rig working.

The PIN diodes are on the high pass filter assembly, rear. You can find PIN diode test procedures here:

http://www.zerobeat.net/drakelist/tr7bookalign.html
http://www.wb4hfn.com/DRAKE/DrakeArticles/InsideTheTR7/Inside_The_TR7-11.htm
http://www.wb4hfn.com/DRAKE/DrakeArticles/PinDiodeTest.htm

However, there is a tendency to point to the PIN diodes as the root of all evil when there are strange problems. Other possibilities for your problem are:

1. Predriver gain pot set too high.
2. Leaky driver transistors on the PA board

Sure 444, D-104 (non-amplified), Turner 254HC, Electro-Voice 729, or just about
any other high impedance mic.

Good grief! There's practically no space between the R-4C and the T-4XC. Evidently, there's not much of a heat problem in the R-4C and furthermore, any heat that does come out of the R-4C doesn't significantly warm up the T-4XC. It seems hard to believe, but this setup had Drake's blessing I guess.

Drake actually made a stacking cabinet. The transmitter was on top/receiver on bottom. I had one a long time ago. Worked well for years. Yes, it's OK to stack them. Just put the transmitter on top because of the added heat created by the finals.

Yes - on FD back around 1971, we used a Drake pair (believe it was an R4/T4X) with the factory stacking cabinet. There were no problems over a 24 hour period with the temperature between 90 and 95 degrees.

It's also entirely possible that the PA brick is oscillating. A while back, I found that if you adjust the pre-driver pot on the PA unit for maximum output on 10 meters, all was well when testing into a dummy load on all bands. But, when I attached a real antenna with just a bit of reactance, the PA oscillated on 40 meters. When I adjusted the pre-driver pot for 75-80 watts out on 10, per one of the members here, the oscillation was cured. My PA had new transistors installed (not the same ones as original), so maybe it was more prone to oscillation than it would have been with the original transistor type. I don't believe your problem has anything to do with the PIN diodes.

Add to the list, a Electrovoice 664D (works excellent wired for high impedance), and a Shure Unidyne high impedance or any other older Shure high impedance mike, if you have a stand to mount them.

Shure used to make a S40A stand that had a PTT switch. You could buy a short pipe and/or mount the mic directly, route a short cable into the base, and then back out to the rig. I've done both the 664D and a Shure 545S (Unidyne III) this way. I use the 664D with the TR4C and the Shure 545S with a TR7. Both offer excellent audio reports.

The TR4's do seem to like a higher impedance than some other rigs. 500k or so seems to be the preferred range, but anything above 50k should work.

I experienced a similar problem. I backed off the pre-driver to 90 watts on 10 meters and the rig is stable on all bands There also is the possibility that the grounding of the pre-driver and final PA is not a solid due to corrosion from ☐the passage of time.☐ You might clean the grounding points of the boards and other ground connections while you have the rig open.

But, when I attached a real antenna with just a bit of reactance, the PA oscillated on 40 meters. When I adjusted the pre-driver pot for 75-80 watts out on 10, per one of the members here, the oscillation was cured. My PA had new transistors installed (not the same ones as original), so maybe it was more prone to oscillation than it would have been with the original transistor type. I don't believe your problem has anything to do with the PIN diodes.

Hello.

Speaking of stacking, anyone have one for sale?

I have a R4 / T4 exciter (no vfo) that would look grand

stacked in a CA-1.

Happy and Healthy 2010.

First test: Listen to the output with a second receiver. Is this a clean carrier on the expected frequency? If it's the final oscillating, it may not even be on the carrier frequency and it will likely not be a clean sounding note. If it is a clean note, it is probably not an oscillating final. In that case, look around the balanced modulator. A dead component in the balanced modulator will unbalance it and cause carrier output. It may be as simple as adjusting the carrier balance control, although I don't think the range of this control will allow full carrier. In any case, check the balanced modulator.

Incidentally, another test for an oscillating final is to connect to an antenna. If the VSWR is unusually high, it means the output is not on the expected frequency (assuming a normal antenna with limited bandwidth .... a log periodic might not care).

Good luck. I'm new to this drake stuff; my wife just gave me a B-Line for Christmas (with a little guidance ... I drover her over to the guy's house, pointed to the radio and said "this one". She wrote the check). I'm really impressed with Drake gear.... hard to believe my B-Line looks and works so well after 41 years. Good stuff.

Probably not PIN diodes. Couple of good possibilities Jim. Certainly oscillation in one or more stages will do the trick!

I would check the +10T and +10R bus voltages. I have seen units where both buses were "ON" at the same time with all sorts of resultant feedback and transmitter output.

That sounds reasonable too. A day that may feel warm to us can be plenty sufficient to cool these rigs as long as there is adequate ventilation. Outside on a FD is ideal. But placing a stack like that in something like a bookshelf system with only an open front may not be adequate in a room at 70 degrees.

God bless

>I experienced a similar problem. I backed off the pre-driver to 90 watts on
>10 meters and the rig is stable on all bands

Yep, there is a tendency for the PA deck to oscillate in the 7-10 MHz band if the gain is too high. Not all units seem to do this. It will present as full carrier indication on 40 meters SSB, but will actually be oscillating closer to 10 MHz. I wrote up my PA adventures for the Drakelist reflector and also the Drakelist online forum a couple of years ago. In a nutshell, it started with leaky driver transistors, which caused strange oscillations and unstable operation on most bands. I rebuilt the PA and predriver using more modern devices as described in an article on wb4hfn.com, but then had the 40 meter oscillation. I eventually solved this by modifying the negative feedback in the predriver to provide more negative feedback at lower frequencies. This, in turn, allowed me to turn the pot up enough to get specified power out on the lower bands and decent power on 10 meters. If I were to persue it further, I would try to find out exactly where the 7-10 MHz resonance is and work to eliminate it completely.

>There also is the possibility
>that the grounding of the pre-driver and final PA is not a solid due to
>corrosion from ☐the passage of time.☐ You might clean the grounding points
>of the boards and other ground connections while you have the rig open.

Good thought too. There is an internet article (don't have the URL handy) by a European ham who went even further to improve PA grounding by adding more ground plane foil to the PCB. I replicated his work when I was rebuilding my PA deck, but my results weren't quite as good as his. As they say, YMMV. I think that I wouldn't rip a PA deck out just to add ground plane area, but if one is rebuilding the PA anyway, it probably doesn't hurt to add it while in there.

Have an R4B that is a little stiff in the dial when cold and gets worse as it gets warm.

Someone has really messed with this radio everywhere else so cud have wrenched in the VFO also.

Is there a drag adjustment inside the PTO? Is it the end bearing?

Curt

Floyd,

I've seen the 40 Meter oscillation in units that have all original devices in the PA deck. Not all radios seem to do it, but I have seen other references to it on the net. There was no "fix" at the time I was searching, but there were vague suggestion that the PIN diodes caused the problem. Of course, this is not the case.

I don't know about adjustments but examine the nylon gears for lubricants. They don't need lubrication and it will swell the plastic. FWIW, brass gears also do not need lubrication.

Curt -

Richard is correct about the grease that some insist on putting on the nylon gears. Some also grease the lead screw, and some put wheel bearing grease in the ball bearings at the front of the gearbox.!!

There is an excellent article on this at

<http://www.wb4hfn.com/DRAKE/DrakeArticles/PTO/Drake_PTO.htm>

It's for the C-Line PTO, but they're the same behind the single, (dual) disc(s).

And yes, there is an adjustment. An Allen screw that supports the single ball bearing at the rear of the lead screw. It should be just tight enough to eliminate any sideplay in the MAIN TUNING knob.

Yes..OK and thanks Garey and Richard.

I had to clean a little off the nylon and yes there was dark grease in the front bearing.

I wondered if there was a specific drag screw--like some other rigs have that use encoders. I guess I need to remove the PTYO for a thorough cleanup and free-up.

Its back from the dead tho.. I'll tell that whole story later.

Happy New Year.

It seems that not all grease is bad. I have found grease on the gears in a couple of pieces of 7-Line gear that I am reasonably sure have never been tinkered with by owners, including the pristine single-owner R-7A that I got last year that I am certian had never been opened up since it left the factory.

Having worked on a lot of equipment and mechanisms over the years (not just amateur radio), the major issue with applying grease of any kind to these kind of gearsets is that they attract and hold dust and crud..

As a general rule, at the low speeds of these sets, nylon running against steel or more nylon is self lubricating and requires only to be clean.

Brass running on steel is the same. for gear faces. A thin general purpose oil in very small amounts might be used on bras busshings with steel shafts but again, excess will hold dirt which is the real culprit.

Nylon is hygroscopic / Hydrophillic in that it absorbs moisture and swells. (not sure of the chemistry here...the first is water absorbtion..like a sponge, the second is actual molecular bonding of the molecules within the material) the only white or natural color plastic that does not (at least amounts not significant) is UHMW Polyethylene. (Ultra High Molecular Weight). Delrin is better in this respect than nylon but still absorbs and swells slightly. So, in the case of nylon gears, they will absorb the oils out of the grease and leave the hardened thickener/fillers behind. They also swell slightly which could conceivably bind up a shaft or gear interface. It is more a problem on close fitting shafts than gear teeth, as the clearances on the teeth are always greater and the swelling is minor.

So..it is possible to use a white grease or teflon-based grease on these but I don't think it necessary given the dust problem.

The ball bearings should have a light application of bearing grease. I use the white lithium/teflon stuff they use in hi-end bike bearings.

Also, the lead screw for the PTO should be steel on brass and not really need any lube, but I have always used a small amount of the same teflon grease on these as well and just tried to keep them as clean as possible, since again, the major dad thing that causes wear is the attracted dust and dirt.

I know this all works because I have maintained my R4a/T4x this way for over 40 years and there is not a lick of slop or drag in them..for all practical purposes, they work like they did when they were new. It is also based upon 30 plus years servicing a variety of industrial and scientific equipment.

Now I need to remove the PTO assy on this R4B and clean it all up so I can start over.

Thanks for sharing all your experiences--I really appreciate it.

The only problem with these Drake radios is they go bad so infrequently, it takes a lifetime to accumulate a lot of fix history..good problem to have I guess.

Happy New Year All.

Richard -

I use 97% alcohol and a toothbrush. One of the features of nylon is its resistance to solvents. Supposedly you could use gasoline, kerosene, turpentine, mineral oil, etc., etc......

I think the key is to not soak them in anything. Dunk in alcohol, brush with a stiff bristled brush, dunk again until clean. DON'T dunk in solvent and then go to lunch! :-)

I'm not sure what the mechanism is that allows grease to cause the gears to swell, (IF that's really what happens,) I'm not certain that the problem isn't just hardened grease inside the bore of the gear. If you've ever disassembled an old greased mechanism, there is a "varnish" that plates surfaces that has to be chipped off with a metal tool! I think this is what this procedure is actually "sanding" off.

The KEY factor here is that nylon gears are intended to run "dry", and NO lubricant is needed or desired.

Jim -

There ARE greases that are specifically designed for "sliding" nylon surfaces. They are typically "clear". Nylon is very chemical resistant, but nylon gearing is designed to be run "dry".

I'm pretty well convinced that the "swelling" is really varnish accumulation in a relatively tight clearance. A tight clearance is desirable to reduce "chatter" when there is no grease!

Curt -

Good information! (Some snipped).

As you say, Nylon IS hygroscopic, but it's a relatively slow process as opposed to fast (like a sponge!) So 40 or so years "immersed" in grease ... I believe my "varnish" is at least a part of your "hardened thickener/fillers", and are the real culprit in the binding of the gear sets.

The tight shaft clearances are a requirement to prevent "chattering" or "rattling" inherent in gear trains.

Interesting discussion!

>
>
> Nylon is hygroscopic / Hydrophillic in that it absorbs moisture and swells. (not sure of the chemistry here...the first is water absorbtion..like a sponge, the second is actual molecular bonding of the molecules within the material) the only white or natural color plastic that does not (at least amounts not significant) is UHMW Polyethylene. (Ultra High Molecular Weight). Delrin is better in this respect than nylon but still absorbs and swells slightly. So, in the case of nylon gears, they will absorb the oils out of the grease and leave the hardened thickener/fillers behind. They also swell slightly which could conceivably bind up a shaft or gear interface. It is more a problem on close fitting shafts than gear teeth, as the clearances on the teeth are always greater and the swelling is minor.

It sounds like there r folks on both sides of this to lube or not to lube issue.

I have seen nylon gears come w/ some grease on them. I would think u could also use a small amount of mica on brass or nylon. Should be nonconductive & dry....never tried it ??? It's a common reloading material, a little bit will do u.

Actually, I don't think there are "two sides" to the discussion.

1. Lube is not required (recommended?) for Nylon gear sets.

2. The PROPER grease isn't a problem.

3. Automobile wheel bearing grease is NOT a proper grease! :-)

It's almost 2010. Happy New Year to all!

First of all, Happy New Year to you and the list members. I hope its a better year for most of us than this one has been.

FWIW, I _have_ seen lubricated plastic gears, but I don't know what plastic they are made of. These are the gears in Sony video tape machines used in broadcasting. We use grease obtained from Sony for these, I have no idea what it is but it looks like Lubriplate of some sort. These are slow speed, low load gears used for positioning the turntables to accommodate various sized cassettes. The gears in the cassette elevator do not appear to be lubricated. Grease is also used on some of the sliding surfaces.

A web search did not produce much useful information. Nylon and Delrin are made in different types several of which are self-lubricating due to the impregnation of the material with a lubricant. This seems to be a Teflon containing material although mention is also made of graphite.

BTW, "Lubriplate" turns out to be the trade-name of a company rather than a specific grease. The Lubriplate company makes a variety of lubricants of different types,

mostly under the Lubriplate name. The stuff in the small
tubes appears to be a silicon based grease with lithium
filler but Lubriplate also makes petroleum based greases.

Now we're getting scary. Self lubricating plastic, sounds chemically reactive to me..hihi..Also reminds me of some "super gear lubricant" that a salesman was plying to my father when Dad was a Port Engineer for a towboat company. This "super gear lubricant" ""actually penetrated the metal in the gear to enhance lubrication""...well, only problem was, this was when stuff actually came in metal cans...He had no answer when Dad asked him, "If it penetrates the metal gear, how does it stay in the can?" Case closed on that one.

As for plastic gear lubricant,,,"To lubricate or not to lubricate, that remains the question"..

HAPPY NEW YEAR

I can't stand it any more...

You need to identify the material involved before you can determine if it should be lubricated or not. Plastics and synthetics are petroleum based polymere's. As such, and dependant upon their molecular structure and the applied lubricant you may have a breakdown of and/or absorption into the original material. The same holds true for metallic compounds; again depandant on what is in the lubricant and the porosity of the metal.

Lubricant is applied to a surface subject to torque and rotational force to act (1) as a lubricant to preserve the original surfaces and (2) carry away heat. And someone made mention of this, in a non-sterile environment a lubricated surface will cause foreign material to adhere.

Bottom line: don't lube it....

As for the "super gear lubricant" not leaking through the can.... That dates back to about 1955 or 56 and it was called "Steen C". It was a pure chemical lubricant most often used in race engines. Penetration was only into the first (or surface) molecular level...

Happy New Year and 73's...

Many thanks to Jim Shorney NU06 for putting me onto the page of Stefan DL7MAJ . This has helped me sort out the wiring for my PS7 which is now switching on and receiving. I may also attempt the mod. that Stefan has designed to prevent initial power surge to the TR7. If anyone should need this wiring information in future I have sketched and photographed it and will happily pass it on.
happy new year to all

HNY All:

Well, I'm gonna show my age/ignorance of new tech now..

I've been using the TR7 for a bit and really like it. Even with the B sitting next to it.

But...tell me your procedure for getting exactly on another stations frequency using CW.

I'm close but never right on. it seems to depend on ones abillity to set the incoming rx to the offset freq consistently.

I guess I've been using the twins in sep mode too long. Never had to deal with RIT and offset CW.

With alot of ops using 200Hz filters, you can't miss by much and still get heard.

Anyway, please share you techniques.

If you've got a reasonably musical ear, set the rx so the station you want
to match is exactly the same pitch (800Hz?) as your sidetone. I can hear a
few Hz difference as sharp or flat, and I don't think I'm unusual (well,
you know...)

I am pretty tone deaf so have to use something else besides my ears.
I split the audio out from my TR7 (to external speaker and to the input on my PC). Have CWget running on the PC and have already set the pointer (of CWget) to the exact sidetone frequency of the TR7. Then I tune the TR7 RX so that the other station's signal lines up on CWget pointer ... dead on.

Curt -

Yeah, it's not easy. Matching to tones works, _IF_ the 'other'
station is using the same sideband that you are. It was easy with the 4
Series, the transmitter was always on LSB (CW), and the receiver
'favored' LSB for CW (bandwidths of the Passband Tuner all line up).
THEN came the "new" rigs that used USB for CW, and receivers that could
be set to either sideband, with neither one 'favored'.

This is yet another reason I prefer the Passband tuner filter 'slopes'
over crystal filters. I also typically use the 1.5 / 1.8kHz bandwidth.

2930. Re: FAILED S - Meter (s) on DRAKE SPR - 4 (s)

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-02 19:11:59 UTC
From: Hans-Joachim Empel
Topic: 2930 Message: 2930

Hello to the group ,

I have a small question about DRAKE SPR - 4 Signalmeter (S) Meter

I am the Owner of 4 SPR-4(s) and i have a Problem on all four receivers.
I have no signal indication on all 4 S-Meters in (AM . CW , LSB , USB).
The S - Meter Needles are staying all left side below S - 0

The RX (s) are receiving very good and without problems in all modes.
Also the signalstrenght is excellent , i need the Gain - Poti not more open as one quarter (1/4) open , the signals are loud and clear.

If i am using the Receiver of my TR-7 for reference , the Signalstrenght at the TR-7 is between S 9 and S 9+20 as Signalindication.

Has anybody an idear , why this can be happen that i have no Signalstrenght - Indication on the S - Meters for my SPR - 4(s) ?????

Any Idear Help ore Solution from the Specialists are welcome.

Kind Regards and a HAPPY NEW YEAR 2010 from Germany

Joachim
DL2388RB

(sorry about my poor english , i have to learn a bit more english).

Joachim -

I've never owned an SPR-4, so can't speak from firsthand experience.

The Drake manual is excellent, with all the information that Drake left out of the other manuals, such as board layout, voltage charts, etc., [shameless plug] (but IS on my CD's!)

First, I would say it is extremely unlikely that all four receivers would have the same failure! Were all of these receivers obtained second-hand from the same source?

The S-Meter circuit essentially measures the AVC voltage, and there is an internal mod to 'turn the AVC off'" that is described in the manual. This is the most likely situation, IF all came from the same source. If not, a good portion of the S-Meter circuit is inside an IC, and perhaps that IC is unreliable, but I haven't seen anything to indicate this.

So.... I would suggest downloading the manual, if you don't already have it, from Mods-dk site.

<http://www.mods.dk/manual.php?brand=drake>

Add to that mix, the TR-7 shifts the transmitter from the dial reading, while "other" radios shift the receiver from the dial reading. A subtle difference, but an important one when someone asks you to meet them on "xx.050" MHz.

Nope..straight auction by a user with a 1 area call for user ID.

It was listed as being in very good condx and the PA, in another listing, was listed as having the Heath Store upgrade.

The AC-4 went for over 300. !!

Many bidders on each also.

Thanks Guys..the tone match works well for me..was a horn player for years. I had to go back and see that the offset and sidetone come from the same place.

Now..this seems like another use for the worthless "store" button. press for a sidetone to match with.

Did work stations in every call area except HI in the last two days for the SKCC straight key anniversary event. Most were easy single calls, barefoot to a Windom 40. HI is a tough path with 100W and a dipole on 20M!

Having fun with it tho.

Need to find a RV-7.

Jim,

Go for it!

As we know, the AC-4 (and AC-3) doesn't get better with age. The now +40 year old AC-4s, I am convinced, are just accidents waiting to happen unless the filter caps are upgraded and a three-wire grounded power cord installed.

We in the Drake collector and restoration community need to get the word out to the newer members about the potential hazards with the aging AC-4/AC-3 supplies and encourage them to perform these upgrades if they can.

By the way, I am, like many hams, a very satisfied customer of the Sunlight Energy Systems AC-4R upgrade and have no financial interest.

Best.

Richard,

Yes, it's the same and it's better to do it now than later. If the caps give out on your AC-4, the finals could be taken out as well.

I learned the hard way with a Hygain/Galaxy GT-550A a few weeks ago. I put off ordering replacement caps for the PS and one cap failed taking out the 6LB6 finals as well as a few other items in the radio. Better to be safe than sorry.

2942. Re: R4B receiver help

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-05 19:14:26 UTC
From: skipp025
Topic: 1664 Message: 2942

Hello to the Group...

I received a direct Email regarding some information on one of the www.radiowrench.com/siltronix web pages. In specific the use of Tarn-X and similar cleaners on switch contacts. The Email author mentioned the below post so I joined this group, found the original Dec 08 post and would like to comment on the Subject.

> December 2008
> Garey Barrell <k4oah@...> wrote:
> This comes up every once in a while, but Tarn-X on switch
> wafers is a _VERY_ bad idea.

When properly used in moderation, it works very well. But it should be completely displaced after application.

> First of all, the black silver sulphide on the wafers
> is very soft, and does no harm to the continuity of the
> switch.

I don't agree, it is a residue and when allowed to build can cause intermittent switch operation. Especially on lower cost wafer switch assemblies with modestly light wiper contact pressure.

> If you look closely at a wafer that is blackened, you will
> see a very fine line of silver showing through, which is
> where the contact area is.

When the contact is being made, not always the case.

> The sulphide is very soft, and is easily displaced by
> the wiping action of the switch in normal operation.

"Silver Sulfide" (or Silver Sulphide in British English)

Not soft enough and not always well displaced by the wiping action of every wafer switch in normal operation. Prove it to yourself by trying to carefully displace the the black oxide film on a spare vintage wafer switch contact. Try a red rubber pencil eraser and see how easy that tarnish is displaced.

> If a switch is unused for a period of time, the sulphide
> will "grow" back,

The rate of which depends on the atmosphere where the
equipment is placed. One can limit and restrict the rate
with smart application of other treatments applied after
the contacts have been proper cleaned.

> but merely exercising the switch will restore operation.

I have not found the above to be the case in every example.
In fact I have found the exercise method to produce
problematic and inconsistent results.

> DeoxIT does help in cleaning and "protecting"
> the bright silver stripe, and slows the reforming of
> the sulphide.

I do agree...

> The other thing about sulphide is that it is
> "self-limiting", i.e., once it covers the bright silver,
> it stops "growing".

When a classic consumer electronics wafer switch contact
is dark black, it is probably intermittent and just
exercising it does not always restore 100% contact/operation.

> On the other hand, Tarn-X is a chemical that in conjunction
> with moisture from the air actually corrodes the
> brass/copper base of the switch parts, and causes
> considerable damage if not removed entirely.

So the key issue is to use and displace it completely.

> Anyone who has worked on much electronic equipment has
> seen switches that have been damaged beyond repair by
> application and incomplete removal of "silver cleaners",
> both chemical and abrasive.

But not a lot of chemically damaged beyond repair equipment
in any alarming amount... there will always be people
who jump in to a repair with the wrong tools, chemicals and
equipment. "You can't fix stupid..."

> They are for cleaning silverware, NOT for electronic
> equipment.

Let's just say we have a difference of opinion. With the
proper use and care, Tarn-X can become a very useful
compound to have as a cleaning chemical resource.

> By the way, DeoxIT is NOT an effective cleaner for silver
> cleaner residue,

Has that been a problem somewhere?

> FLUSHING the area with a lot of water or alcohol is
> required to remove it.

I often recommend non-residue leaving electronic contact cleaner sprays to displace compounds. It would be good news to advise the person seeking information to read the spray cleaner label to ensure it is both non residue and compatible with all the materials in and around the switch contacts.

> Bottom line is that silver cleaners have no business in
> electronic equipment, and cause far more harm than good.

I don't agree... it's my opinion they have their place when properly used and removed as part of a complete wafer switch contact recondition procedure.

> If you plan to display your receiver with the bottom
> off so viewers can see the bright, (non-functional}
> rotary switch parts, silver cleaners are useful...

So the complete story must be told... if you use some specific contact cleaners, they must be completely displaced/removed. Simple enough...

> Sorry for the rant, but I have seen more than a few
> switches damaged by silver cleaners that reduced
> the equipment to a parts unit.

I've seen more than a few wafer switch contacts made unusable by silver tarnish build-up of which "exercising" does not reliably fix in every case. The tarnish build-up is not as soft as you would hope it to be...

If you proper clean and treat older wafer switch contacts they are clearly able to better perform their job better.

cheers,
skipp

Skipp -

I have no problem "agreeing to disagree"! :-)

You make several excellent points in your rebuttal to my original post. I believe the "disagreement" is caused by my tendency to think that someone who asks how or what to do, they probably don't have much (if any) experience in the area.

Yes, as you say, most any chemical "cleaner" can be safely used IF you remove any residue completely. Seemingly a minor point, but no matter how much you emphasize the facts, a person without experience (see above) is almost certainly not going to follow through, read all the labels and consider the chemical residue that may or may not remain.

Along the same lines, I cringe at the thought of this same person pushing picks, Q-Tips and other tools around the fixed contacts of a phenolic rotary switch that is "A" fairly delicate, and "B" essentially irreplaceable. Especially when it is almost certainly not necessary to enable reliable operation.

Yes, I have seen switch wafers that have been blackened with Silver Sulfide and/or other unknown chemical reactions, possibly from "contact cleaners" sprayed indiscriminately. I'm not a chemist, but I have seen switch wafers with a black, HARD coating that resisted several types of cleaning. My contention is that this switch and associated electronic device is going to need more help than contact cleaning! :-)

So, perhaps I underestimate the capabilities of the questioner, but I'd rather err on the side of caution than have someone damage their unit beyond repair when "I did just exactly what ... said to do!", and now my radio doesn't work at all.

Thanks for taking the time to comment, and stick around if you have any interest in Drake equipment!

Garey is ever the diplomat.

What I said a couple of years ago after taking in two TR-4s for repair that had been "Tarn-Xed" was : Tarnex is a urea based compound so in essence you are pissing in the radio to try and clean the switches. The residue is very conductive when exposed to the DC voltages in the tube radios so arcing across the wafer and /or the rotor to shaft causes gross failure of the insulation. The rotor has several little nooks and crannies that capture the Tarn-X and it is very difficult to ensure that ALL the crap is cleaned out.

Shipp, if you'd like to practice your skills on replacing the switch sections I can sell you a fixer upper pretty cheap.

Tarn-X contains thiourea which is a reducing agent. Its purpose is to convert silver oxide back into metallic silver. I am not sure what it does to silver sulfide, which is a much more stable compound and harder to remove. It also contains sulfamic acid.
My experience with switches is that Tarn-X is no more effective than contact cleaner. I have found on some switches that a small amount of Tuner-Lube will keep them quiet for a long time. An example is the band width switch in my Hammarlund SP-600 which was perpetually noisy. I tried all sorts of things on it but nothing was more effective than De-Oxit and that for only a few days. I then tried cleaning it with De-Oxit followed by 99% spray Isopropyl alcohol and coated with just a bit of Tuner-Lube. Its stayed quiet for perhaps a year now. I don't know if this would work on a Drake receiver but its worth a try.
I got the spray alcohol at Fry's, a computer chain. The purity of the alcohol is really a measure of the amount of water in it. Pure alcohol which is allowed to be in contact

with the air will eventually absorb moisture until it
becomes 91% which is an equilibrium point. Dry alcohol is
important for some uses since it will evaporate without
leaving moisture behind. The spray stuff stays dry in the
can. It is the next best thing to tri-chlor.
I am pretty sure Tuner-Lube is safe on Bakelite wafers
and is not conductive.

Sidetone cable is connected
Does not work in Tune mode.
V7 is a 6AU6
V7 is lit. Did not check voltages.

Still no sidetone.

Makes no difference if the sidetone cable is connected or not so something may be open. Any suggestions?

OK. I think this is a C Line.?

I'm assuming the relay pulls in?

Check the following in descending order of likelihood.

Bad Open/Shorted cable.

"Spread" RCA jack at either end.

Bad R86.

Bad/Dead V9B

Bad S-1A(Front)

DC Voltage checks are next.

Thank you Garey and nice to meet up with you and the other Group Members. I try to keep these sort of conversations informal and provide the information as best I can. It's been my experience that many of the people on the other side of an issue seem to take any type of disagreement as a personal attack and then the topic gets derailed. I'm very happy to see everyone's replies are very civil and informative, which is what this sort of Group should be about.

> You make several excellent points in your rebuttal to
> my original post. I believe the "disagreement" is
> caused by my tendency to think that someone who asks
> how or what to do, they probably don't have much
> (if any) experience in the area.

I have the same tendencies... and sometimes it can take a tremendous amount of time trying to explain the proper methods to get things done. And of course when you're dealing with an "I can't wait" type of person things can and sometimes are "over-looked".

> Yes, as you say, most any chemical "cleaner" can be safely

On some of the other Groups I frequent... we try to beat the drum loud enough to ensure the information gets clearly posted. But sometimes you've got to beat the reader in the side of the head before you hit the drum... and even that doesn't always work.

> Along the same lines, I cringe at the thought of this same
> person pushing picks, Q-Tips and other tools around the

Golden Screwdriver types often dive in regardless of what you
write or say... we've all seen their train-wrecks.

> Yes, I have seen switch wafers that have been blackened

> device is going to need more help than contact cleaning! :-)

Coatings can be removed in most cases, damage to the base
metal structure is the bad news and re-plating wafer switch
contacts is actually pretty easy. Just a question of how in-depth
you want to go with a repair.

> So, perhaps I underestimate the capabilities of the
> questioner, but I'd rather err on the side of caution
> than have someone damage their unit beyond repair
> when "I did just exactly what ... said to do!", and

I totally understand... I normally would not advise a newbie
to do certain tasks unless I was fairly convinced of their
sincere effort to try and correctly do a procedure.

> Thanks for taking the time to comment, and stick around
> if you have any interest in Drake equipment!
> 73, Garey - K4OAH

Thank you for the kind words and I'll hang around. I'm on the
prowl for a Drake 2NT Transmitter. I'm interested in the T/R
Switching Circuit and comparing the operation to a Heathkit
HW-16.

cheers,
skipp

I was very pleasantly surprised and pleased to read his
very civil reply.

> Tarn-X is a urea based compound so in essence you are pissing
> in the radio to try and clean the switches.

Tarn-X is a thiourea based compound and mostly water.
Only similar to urea, except that the oxygen atom is replaced
by a sulfur atom and The properties of urea and thiourea
differ significantly...

> The residue is very conductive when exposed to the DC
> voltages in the tube radios so arcing across the wafer
> and /or the rotor to shaft causes gross failure of the
> insulation. The rotor has several little nooks and
> crannies that capture the Tarn-X and it is very difficult
> to ensure that ALL the crap is cleaned out.

So the key is to ensure the power supply is clearly turned
completely off and disconnected from any source.

If you use certain types of cleaning chemicals during
service, some of them must be properly and completely
removed.

> Shipp, if you'd like to practice your skills on
> replacing the switch sections I can sell you a fixer
> upper pretty cheap.
> 73, Larry K2LT
> drakerepair.com

Thanks but I'm OK with work right now...

I've got a shop full of "fixer-uppers" waiting in line to
be restored after my land-mobile radio service work-load
queue drops. The paying customers get my attention first so
I can keep the lights on.

If the radio you're talking about actually needs wafer
switch sections replaced, I could and would be able to do
it and I also probably have the parts in stock (I've been
in the business that long) but the bigger questions are:
would it be cost effective and completed in a timely

manner?

cheers,
skipp

Check the power supply for ripple. The increased low
frequency response of the phones may be making hum which has
been there audible. I noticed 120 hz hum in my RX and found
the first filter cap section was bad. I use relatively high
sensitivity phones on my set and do not observe hum.

Also possible.

Quick check... Where do you set the AF GAIN control for a comfortable listening level with your phones?

"Good" phones have more low frequency response than Drake considered when designing the AF Amp.

If very low, probably a sensitivity problem. If 10 - 11 o'clock, probably a power supply problem. If power supply problem, you could try reducing the value of C167 to 0.01 uF or lower. This will reduce the low frequency response of the amplifier, but if you go too far, SSB will sound "thin" and low CW tones will be reduced in level.

Perhaps I should buy another headphone set!! I bought these for the extreme comfort and lightness. Prior to this I had the Heil ProSet Plus and liked them but after awhile they felt like a waterdowned mop on my head.

The headphone jack is paralleled with the loudspeaker with a contact in the jack to cut out the loudspeaker. You could as well connect the speaker to the headphone jack. The RX does not seem to be critical of load impedance.
I just checked the audibility of residual hum and normal AF gain position with several pairs of headphones with impedances varying from about 20 ohms to 20,000 ohms. The only ones I hear any residual hum on are the 20 ohm pair. These are cheap Radio Shack Hi-Fi phones which have a switch for mono. The impedance is what is measured with this switch in mono. The hum is very low level and really audible only if I turn the RF gain all the way down. It is independant of the AF gain position. These phones are very sensitive so that comfortable listening level is with the AF gain just cracked a little. The other phones are of various types but at least one has good low frequency responce. The comfortable listening level with all is about 1.5 to 2 notches up from minimum. I can't hear the residual hum in any of them.
So, there is just a little hum but unless these phones are extremely sensitive it should not be audible. If comfortable level is with the AF gain control just cracked, as it is with my Radio Shack phones you might want to make a simple attenuator to go between the phones and the radio. If the AF level for normal listening is higher than just cracked and you still hear hum investigate the filter caps.

While we are on the subject of hum, I have a question. I have a R-4B that I am in the process of replacing the old electrolytic capacitors and was wondering if I should be up grading any of the caps capacity wise?

If the hum is unrepentant of the audio gain position it is probably power
supply ripple getting through the output transformer.

2970. Re: [DrakeRadio] Re: Headphone Hum

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-07 03:32:02 UTC
From: Garey Barrell
Topic: 2958 Message: 2970

OK. Remember that the AF stages run at full volume ALL the time. The output level is determined by how much signal is applied at the input to the amp.

So. With NO signal applied, the s/n ratio is all noise, no signal. When you apply a little AF with the AF GAIN control, the s/n ratio is stil pretty bad. It's not until you apply more audio (AF GAIN to 10 - 11 o'clock) that the s/n ratio begins to get good.

The 'fix' is to put a resistor in series with the headphones, either in the plug or in the receiver, so that you have to turn the AF GAIN up to get to listening level. The source impedance is very low, probably an ohm or two, so the impedance of the phones is the controlling factor. If you have 8 ohm phones, and 8 ohm series resistor will drop the level by 3 dB. Not much. With a 78 ohm resistor, the level drops to about ~10%. Easiest is if you have a 2-500 ohm pot, put it in series, set it to 500 ohms. Turn the AF GAIN up to about 11 o'clock and then turn reduce the series pot until the AF level is what you want. Then either leave the pot or measure the resistance and sub a close resistor.

I know the Heathkit shop makes an upgrade for the AC-4
power supply, do they make one for the R-4B also? The input
cap went bad on mine and I have makeshifted a cap under the
chassis but don't like that sort of thing. I suppose I could
restuff the can but it would be nice if I can get one ready
made. I will check their web site. I discovered the cap was
bad because I could hear 120 hz ripple in the speaker.

Good Morning All:

I have the Drake 500Hz and 300Hz filters in my TR7. Is it normal for the output to drop 10dB going to the 300Hz? Level remains same going from 2.3kHz to 500Hz but drops thru the 300. Not talking about the APPARENT level reduction do to reduced noise bandwidth but a real level drop as seen in Spectran.

Absolutely.

A cap under the chassis is ok for a temporary fix, but since loss of electrolyte is the usual cause of cap failure, and all the sections in a 'multi-section' cap share the same electrolyte ...

It's also not a good idea to just bridge a single cap across the failed cap section. Loss of electrolyte is often followed by dead short.

Best, and easiest, fix is Hayseed Hamfest's multi-section replacement that drops right in. He also includes the other individual electrolytics that might as well get the ax while you're in there.

Well, it "drops right in" _AFTER_ you unsolder the old can from the chassis!! NOT a trivial pursuit. Many vacuum desoldering tools don't have enough heating power to melt solder on a chassis. Best I've found is one of the old fashioned spring loaded "Solda-Pult" devices with a BIG iron or even solder gun. Don't forget also that the insulation on the wire Drake used is _EXTREMELY_ heat sensitive. A careless soldering iron can destroy a wiring harness bundle in a fraction of a second.

Try moving the Passband tuning back and forth to see if the noise level comes up. It may be that the IF frequency is within the bandwidth of the 500 hz filter, but on the skirts of the 300 hz. If this is the case, then the IF needs to be shifted to center in the 300 hz filter. Spectran will help you do this.

2980. FS: Unique Drake Service Supplement CDs

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-07 17:48:09 UTC
From: Garey Barrell
Topic: 993 Message: 2980

Here is the information that Drake left out of their manuals!

Unique supplemental service information CDs available for the Drake TR-4, TR-4C/Cw/CwRIT, B and C
Lines and the 2-B receiver.

High resolution color photos of the under chassis and individual PC boards of each unit, with all
parts identified and keyed to a parts list make it easy to locate any component. No more trying to
trace wires through bundles, etc. This information is not available elsewhere and really makes a
difference in servicing these units.

These CDs are NOT just scans of the original manuals that were included with the equipment when new.
High resolution scans of the original manuals ARE on the CDs, along with scans of manuals for
associated equipment such as the C-4, FS-4, MN2000, L-4B, W-4, etc.

Samples of these pages (at reduced resolution) and purchase information are at <www.k4oah.com>.

The MOST important filter is the white one. I made the mistake of purchasing these important blue filters but without the white filter you will still have a terrible looking green dial. The white filter may appear white but is really yellow and this is what causes the greenish looking dial.

If anyone knows a source of the white filters please let me know.
Thanks.

I certainly agree about not bridging bad caps. I
disconnected the bad section all together. Leakage of
electrolyte is not the only failure mode for electrolytics,
for instance, there can be changes in the paper separators
that cause leakage to go up. While most are familiar with
"ESR" that is series resistance and the problem with both
electrolytics and paper caps used in some applications is
parallel resistance, AKA leakage. This can cause the cap to
heat up which accelerates the failure.
I've written to Tom asking for details of the
replacement kit. He has an announcement that some types of
multiple section caps are not available because of a
supplier problem, I hope the one I need is not among them.

2985. BEST MIC FOR A TR-4

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-08 12:38:30 UTC
From: VE3FMC
Topic: 2985 Message: 2985

I recently acquired two Drake Tr-4's. One came with an amplified Turner Plus 3, the other with a non amplified D-104 (looks like the standard cartridge)

The one TR-4C sounds pretty good on the air with the Turner. The other, a TR-4 sounds like crap with the D-104. Tinny, no lows at all with that mic.

Now before I start changing mic plus to test mics, (the TR-4 has the 3/8" phono jack, the TR-4C has the 1/4") I would like to see which mic others run with their TR-4's.

I want to get rid of that tin sound, I have listened to myself on another receiver and the audio from that mic is brutal to say the least.

Thanks in advance for any advice posted.

73, Rick VE3FMC

Rick -

The D-104 works fine with the TR-4. Perhaps you have a problem with the TR-4?! Does the audio sound "tinny" on either sideband? The TR-4 is a little different, the same filter is used on different bands because of the mixing scheme. Try listening to your signal on the "normal" sideband, then switch to the other sideband by changing the SIDEBAND switch. IF the audio is "bassy" on the "wrong" sideband, the Carrier Oscillator needs adjusting per the procedure in the manual. If you have "tinny" audio on BOTH positions of the SIDEBAND switch, then there may be a fault in the D-104. Typically D-104s either work, or don't, if the load impedance is correct.

Assmuming the above test does not turn anything the load impedance may be the problem. Crystal mics want to see an open circuit, their internal impedance is essentially a capacitive reactance. If there is parallel resistance it will cause a loss of low frequencies. Its possible one transmitter has a resistance across the mic jack for some reason.
Have you tested with another mic of a different type?

If you have access to a spectrum analyzer with enough bandwith to look at the USB and LSB crystal filters on your TR-4, - or a calibrated signal generator and RF voltmeter for same, you should take a look at the actual sideband filter passbands on your TR-4s. Some of these (especially the early 4 pole filters in the "tin cans") have aged and have changed frequency a bit with time. This can result in cutoff low audio frequency ranges on one sideband or the other. You may need to align the (nominally) 9MHz oscillator with the actual crossover frequency of the upper and lower sideband filters so that the audio sidebands for USB and LSB cover the same frequency ranges.

I use an Electro-Voice Model 638 mike with my TR-4, and have received good reports.

OK as suspected it was the mic. I loaded the rig up into the dummy load and listened to my audio on another rig. Lower and upper sideband both sounded the same.

Changed heads on the D-104 which helped it a little bit. Might have been a bad cartridge in the original head. But the audio still doesn't have a lot of lows. I was told on the air by another Drake owner that is is typical. He had the same problem with a pair of Twins until he changed to an Electro voice 638 mic.

Checked those out, found a couple on Flea Bay and YIKES those are not going cheap!

Thanks for all your help.

From: VE3FMC
Topic: 2990 Message: 2990

Any idea what an RV-4 with the built in AC4 and speaker would be worth on the market these days?

I have the chance to buy one but do not want to over pay and can not seem to find any for sale online.

Thanks

I have an RV-4 and RV-4a. I bought one to fix the other and ended up fixing both. Watched ebay for a while before I got mine, so saw prices vary over a wide range. They seemed to show up for auction in spurts. I would say the power supply by itself is worth $50 if working, and more if it has the update kit with circuit board and new HV diodes and caps installed. You ought to be able to find a decent RV-4 for around $120 or less IMHO, though I've seen them get near $200 in a bidding war. If you have one shipped, make sure they remove the power supply from the case and ship it separately, or you'll wind up with a warped and dented case. Drake manuals had a warning about this.

2993. selling TR-3 on Ebay...what is it worth?

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-09 15:27:02 UTC
From: CopaDave
Topic: 2993 Message: 2993

I am cleaning out the shack storage and posted my old TR-3 on Ebay last weekend. Not really knowing what it was worth, I set for $75.

This morning I had the blinding insight to post this message, which I should have did last weekend, and see if that is a fair price or if I should go higher or not.

The radio has been in storage for over 20 yrs. The volume knob has a piece missing, but that is the only cosmetic damage (other than routine wear).

I don't know if it powers on or not, but I do have the power supply for it as well.

I'm not shilling for bids, but can someone take a look at it and tell me if I'm too high, or about right? The only bid is from a resaler, and I'd rather see it go to an actual Drake user/lover.

I'm on my cell phone so I can't cut and paste a url, but it's item number 190362476951.

Try adding a 470K (or higher) resistor in series with the mic element.

Bob,
D-104's, without the built in amplifier, are good mics for Tr's and Tx's. Many people found that the higher frequency response was very good for DX work. That was well before today's processors and DSP filters. If your D-104 is wired straight through (open the bottom up and see), then it is wired stock, and will sound higher pitched. Some might say a bit "tinney". All depends on your voice. But really, its the lack of low end balance for normal voice characteristics. Definitely a communications mic....period.

Quite often, hams who want to use these mics for normal rag chew or nets add a resistor in series to the element. Actually, the TR4 will like the higher resulting load and you'll not see significant loss of audio. I settled on a 220k resistor in mine to sound best for my voice. A good way to find out is to hook up a substitution box to the mic line and switch in several values to see the difference. I used a guitar amp to listen to myself and determine the needed value. You'll need a high impedance amp to do this, or,... go through the rig and listen to the resulting transmitted signal.

Lastly, you should change back the 1/4" jack to the .208 it was designed for. That way you won't stick your 8 ohm headphones/speaker in the mic jack....thereby potentially causing unecessary grief.

Shure 444's and the like work very well in the TR's with more low end response. I use either the D-104 or a Electrovoice 664d (set to high impedance). I prefer the Electovoice overall.
Good luck,
David

2996. Drake 2B recap question

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-09 16:30:43 UTC
From: ejj@suddenlink.net
Topic: 2996 Message: 2996

I purchased a 2B recently. The owner didn't know history and only said it lit up. I have not turned it on. My plan is to replace electrolytics and tubes. Serial number is 6599. The chassis says it should have a 8BN8 but a 6BN6 has been substituted. The large multisection capacitor has a 20 mfd Sprague elctrolytic that appears to have been added. It runs between the 100mfd lead with a 1500 ohm resistor also attached and the terminal furthest from the front on the terminal strip just under the transformer in rear of chassis.

Questions: Should I switch back to a 8BN8? or does it make any difference?

I have a multsection cap just like the original. Should I replace it and remove the 20 mfd cap? Any ideas on that cap? Maybe added because the original was failing?

Thanks

EJ K5EJ

Hi Dave

That is the answer I was looking for, the value of resistor to add into the mic line.
I talked to a guy yesterday using that mic. He told me the audio was clear but did not have any lows. As you said, good DX audio but not good for rag chewing!

Thanks for replies guys.

There is some hard data on this page about what happens to the D-104 response with different values of load:

http://members.cox.net/n4jk/d104.htm

The FET buffer circuit is not really needed, the D-104 has plenty of output to drive most radios with the added resistance. As I mentioned, I have used 470K in the past. Using this with the high-level input on my TR-7 (another 470K) puts it at close to a megohm load, and has garnered excellent audio reports. I don't know what the input load of the TR-4 is, but as David suggested, you can experiment with different values of resistance.

The TR-4 has an input Z of about 5M. The additional series resistor probably
reduces the high frequency response by acting as a low pass filter.

3002. TR-6 (TR-4's ?) noise blanker 9-BN caps gone bad

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-09 22:55:14 UTC
From: de_n7ioh
Topic: 3002 Message: 3002

I was just going over my TR-6 getting ready to replace some old electrolytic caps. I noticed the two 1000uf 15 volt caps (C50, C51) in the 9-NB of mine had corrosion coming out of the caps and running down the leads to the PC board. I don't know if this is a common problem but I though I would mention it to the group so others could check them out to see if theirs are bad. I would be interested in hearing back as to what others find. Mine is sn. 570, if it makes a difference. I believe the 9-NB is also used in some TR-4's so it might be worth a look see.

Jim,
I have done this on some noncritical equipment, and used dishwasher detergent. It works well to clean otherwise hopelessly filthy gear, with some care.

Some critical points:
Almost any silkscreened paint or lettering (especially on glass) will be destroyed. Remove silkscreened front panels and glass or plastic dials and meters (don't put any meter movement through this).
As soon as the dishwasher cycle is done, put the equipment in an oven or other heated space at about 200 degrees F and leave it there for most of a day. This will dry transformers, bandswitches, coil forms, etc. before corrosion sets in.
Coils or other items impregnated in wax may come out with a rough surface that makes them look white, but this can be cleared up again with a heat gun or hair dryer.

Back in the day I had done it both ways, but that was with things like T-Powers, Galaxy's, etc. For an old Drake or Collins, Heathkit, etc. either way should be fine. I'm not sure that I'd do it on a more modern radio. If so I'd do it with plain old water.

Don,
Thanks for the invite. I intro'd several weeks ago and asked quite a few questions before concluding what my T-4XC needed was an overhaul. In the meantime I picked up an Icom IC-718, I'm tuning it through my MN-2000, and broadcasting with an MFJ-1796 multi-band vertical. Thus far I've been pleased with the combination. My goals remain: restoration of the Drakes and enjoying 'vintage radio'.

I also recently updated my QRZ bio and added some photo's so take a look at your convenience: http://www.qrz.com/db/KF7GJO

> To those of you who have cleaned a chassis in a dishwasher....
> I need to know if you used dishwasher detergent or just relied
> on the hot water to do the cleaning.

Both really, of course your choice depends on the item's value, available time, the metal type, how bad and what type of "stuff" you want to remove.

In situations where it may not be easy to remove some critical parts susceptible to water/soap damage... I have used a cat-box size plastic pan full of warm (almost hot) soapy water (made of/from Palmolive Liquid Dish Soap) and a series of soft and firm paint brushes to manually clean a chassis.

The process might involve just holding the chassis near or over the soapy water (not entirely immersed) while the repeatedly dipped (in the warm soapy water) paint brushes are used to break dirt and grim loose.

Being careful not to allow water into certain parts... clean warm water is used to flush away (displace) the warm soapy water before allowing the chassis to dry in a proper location.

Most people don't have a proper drying oven and sometimes direct sunlight on a hot summer day is too much... so you have to be smart about the drying location and realized temperatures. A proper drying process is another choice to be made based on your resources and experience. Yeah, lots of choice to be made...

Re: dish-washer use... the key issue is what type of detergent in regards to liquid or powder and how that soap might react with the chassis metal. Some powders like Cascade and similar might react with specific metals and leave trace amounts. While other liquid versions of the same base might react but are more easily displaced during the rinse process. And if there would be any parts on the chassis that would be damaged by a trip through the dish washer.

Many of us who repair and restore radios have "our own tricks" and would hopefully be willing to share our methods with others. With enough investigative home-work you could pick which methods might work best for your needs. In a "well lighted"

public forum (Internet Groups) like this one... some of the more questionable hints and kinks can be talked about/over so any potential issues can be addressed. There are a group of people who wouldn't take a chassis near a dish washer and that's also a viable choice.

With the exception of some variable capacitors and large vacuum tubes... rare is the dirty enough item to need a full on dishwasher event. The exception might be the heavily smoke and nicotine coated item more formerly received from old (most often WWII era) timer estate sales. Nothing like a brown colored Heathkit radio deal at the flea market to get you thinking about a trip to the dish washer.

Nicotine is nasty...

cheers,
s.

The most effective nicotine removal product I have found is GoJo WHITE Hand Cleaner. Seems to take it right off, and so far at least, benign to the things we want to keep!! Rinse off with warm water, keeping water OUT of transformers, meters, etc.

By the way, Drake "IF" transformers are wound on paper cores, for the most part, most sealed, others not so well. Also, some have ferrite "pot cores" that can hold water/chemicals for a while.

If you insist on using a dishwasher for variable caps or items with other "sorta" sealed ceramic parts, be sure the "DRY" cycle is disabled. I've seen a couple of cases where the ceramic literally exploded, apparently because of water being trapped inside the ceramic and converting to steam in the dry cycle. Nothing left but small chunks and some "sand".

Garey and all,

An exception to the above is that the GoJo hand cleaner will remove decals. I have a Collins 310B where the decal showing the location of tubes that was on the inside of the lid disintegrated when I used GoJo to clean the cabinet. Sigh!

Its the IF transformers and similar stuff that worries me about cleaning. When I worked for Hewlett-Packard many years ago we washed incoming equipment using a paint sprayer loaded with dishwashing detergent but anything that could be water or heat damaged was removed first. That included meters, plastic parts (dial windows, etc, and hermetically sealed transformers. The transformers would seem to be immune from water but we found that they were often not perfectly sealed so some moisture could get in but not get out again. That would cause them to arc and fail when fired up again even if the transformer was baked for an extended period of time.
The procedure we used was to remove whatever needed to be removed, rinse off the unit with a hose and warm water, then wash with a paint sprayer with the detergen solution, then rinse again with warm water, then blow out as much water as possible using compressed air. After this the unit was baked in an electric oven at about 130F for several days.
The vulnerability of paper coil formers and of ferrite or dust cores to moisture would seem to me to forbid spray washing without removing them and I would be careful about the heat used for drying. Most electronic and mechanical components, except some plastics, will take about 130F but not much more. One just has to be patient and allow enough time for thorough drying.

Hello

I'm in the "final touches" phase of restoring a basket case unit I obtained a couple years ago. The radio is intact with the exception of the end caps, which I'll fabricate.

Can someone please provide the dimensions? I know it's a tapered part, so I'll need top width, length, and bottom width. Hole placement would be helpful as well, but I can interpolate that from the rig.

I have found that industrial strength "Formula 409", which is still available, not the watered down kitchen/bathroom cleaner that is on the market now, works great for removing nicotine and other dirt and grime!!!

I normally follow this with a good bath or spraying of denatured alcohol - safe on all plastics as far as i know, or wood alcohol - not
recommended on polystyrene plastics - it melts it!!!

An automotive type suctonparts cleaner blow gun works real well, or even a commercial automoti ve paint gun. I prefer the blow gun!!!

If available , "VarSol" parts cleaner is good also, but try it on a sample piece of plastic if possible. Different strengths' of this product are out there!!!

Or if you can afford it, there is a product that is prodced down in Harvey, La., by a company caled "Napasco" that has a cleaning product called "SC-200" that works really gret on all electrincs chassis. we used it in the USAF to clean all our radio equipment. you cna get it in aerosol cans or in liquid bulk quantities starting in the 1 gal. size can.

As far as i know it is stil being made!!! I believe it is carbon tetrachloride based,as it will not burn when exposed to flame or heat.

(Carbon-tetra-fluoro-chloride or is it cloro-fluoride....or something like that - I'm not a chemist but I remember parts of the name)

anyhow, good luck with your cleanng project.BTW, i think "Mean Green" will work in place of "409" if they still make it!

Denatured alcohol is ethyl (drinkable alcohon) with
something else added. The denaturant can be methyl alcohol
or acetone or other solvent. Some of the denaturants can
damage plastics. Isopropyl alcohol is relatively safe but
should be tested. Pure, i.e., dry isopropanol can be
obtained at computer stores in bulk or spray cans. Its
important that it be dry otherwise the water dissolved in it
will be left behind when the alcohol evaporates. Rubbing
alcohol is usually 70% isopropanol and also 91% can be
obtained in drugstores. Neither of these is dry enough to be
suitable.
The solvent you are probably thinking of is
1,1,1,trichroethane, once widely sold in spray cans for all
sorts of cleaning purposes. Its an environmental hazard so
it considerably more difficult to find than previously. It
is NOT carbon tetrachloride although both are chlorinated
hydrocarbons. Carbon tet has been unavailable for decades
due to its very high toxicity. It was really a replacement
for highly inflamable solvents like naphtha.
As long as you are cleaning metal a wide variety of
solvents can be used. Where there is plastic, paint, or
paper such as coil formers, involved much more care must be
excercized. In fact, it may be safer to leave some dirt
rather than to clean so vigorously that components are
damaged.

What is the consensus of using "Brake Clean" on electronic components? It does an incredible job on mechanical parts on race cars and doesn't leave a detectable residue, but before I spray it on my radio I'd rather someone else crossed that bridge and determined if it was great stuff or melted the plastics.

For detail work I'll spray it on a cloth rag then wipe or spray a bit in a plastic spray paint cap then apply it with a Q-tip. It evaporates really fast and is a "known carcinogen in California" (but then, tap water is a carcinogen in California), so gloves and don't breathe it is recommended..

Curious about electronic applications.

Denatured alcohol is ethyl (drinkable alcohon) with
something else added. The denaturant can be methyl alcohol
or acetone or other solvent. Some of the denaturants can
damage plastics. Isopropyl alcohol is relatively safe but
should be tested. Pure, i.e., dry isopropanol can be
obtained at computer stores in bulk or spray cans. Its
important that it be dry otherwise the water dissolved in it
will be left behind when the alcohol evaporates. Rubbing
alcohol is usually 70% isopropanol and also 91% can be
obtained in drugstores. Neither of these is dry enough to be
suitable.
The solvent you are probably thinking of is
1,1,1,trichroethane, once widely sold in spray cans for all
sorts of cleaning purposes. Its an environmental hazard so
it considerably more difficult to find than previously. It
is NOT carbon tetrachloride although both are chlorinated
hydrocarbons. Carbon tet has been unavailable for decades
due to its very high toxicity. It was really a replacement
for highly inflamable solvents like naphtha.
As long as you are cleaning metal a wide variety of
solvents can be used. Where there is plastic, paint, or
paper such as coil formers, involved much more care must be
excercized. In fact, it may be safer to leave some dirt
rather than to clean so vigorously that components are
damaged.

Since almost every imaginable cleaner has been mentioned by this time.....let me add to the confusion.

I bought an old Ten Tec Omni V a while back that was VERY heavily dosed w/ 'baccer juice. It was so nasty I hated to even touch it. I removed all the knobs & methodically cleaned it w/ windex followed by regular armoral, nothing exotic but it cleaned up beautifully.

On the other hand I know a fellow who buys ether (starting fluid) & uses it to clean EVERYTHING u could possibly imagine. Cuts grease & grime 100% & drys instantly.

Gud luck,
b

I think you could also buy them from the Internet. I bought them a while ago. Search for something like "Drake TR-7."

It's very tough on ur liver !
As an additional note..... I've used a lot of carbon tet in days gone by. Best thing to clean brakes & mechanical points in '54 Chevys ever invented. It couldn't be quit as poisonous as claimed 'cause I'm still alive.

It has been mostly off the shelf since the 60's I'd guess but was banned as a consumer product in 1970. I used to get lots of it out of old fire extinguishers....the cool brass kind. It's paradoxical that one of the very worst things u could ever do w/ it would be to spray it into a fire as it makes deadly phosgene gas at high temps !

All this said however.....if I PERSONALLY ever ran across an old brass fire extinguisher that was still loaded I'd snatch it up immediately & carefully transfer the carbon tet into small bottles I could seal up tightly for future use. It's GREAT stuff but definitely not for dummies. Ventilation-ventilation-ventilation !

Does anyone have an opinion on this?

What would be the possible drawbacks?

73, Bruce WA8TNC
==========

I have an OPINION......it's dangerous as Hell !

U can easily blow urself up or maybe just get severe burns all over. It's also one of those things that smells very strong at first but very quickly u can't smell it at all. When u reach that point ur on the boderline of serious trouble. I only mentioned it as a possibility. The man I spoke of may use 24 cans just to degrease a deisel engine. When I see him start that I leave BUT it works great.

I prefer windex, armoral & deoxit but ether is a possibility for severe cleaning in an outdoor setting away from any sources of ignition.

Gud luck,

3024. T-4XC Bias Problem

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-11 20:12:30 UTC
From: Dave
Topic: 3024 Message: 3024

I've noticed a problem with my bias lately. If I set the bias to .1 in the XMTR TRANSCEIVE position it reads .040ma in the RCVR TRANSCEIVE AND SEPARATE position.
If I transmit (CW) in the XMTR TRANSCEIVE or RCVR TRANSCEIVE position
it stays constant.
If I transmit (CW) in the SEPARATE position, after a few transmissions the Bias raises to .140 (or higher) and I have to wait a while for it to drop.
I also notice when checking the Bias in the XMTR TRANSCEIVE position there is about 18 watts output when on Tune in the USB setting, and ZERO watts out when in the other two positions.
I have rebuilt the AC4 Power Supply last year with the Heathkit Shop upgrade kit and checked the "select to test" resistor for the meter and it is correct.
I can't figure out what is causing this change in meter reading in only one position or if it is a false reading of some kind.
Any Ideas ?
Thanks

When I worked at Harris Corp, the test equipment department would wash equipment with a spray gun with some kind of cleaner and then rinse with water. Then the equipment was put under heat lamps.

Wink -

First, the idle current for the T-4X(any) transmitters is 0.07A or 709 mA. The TR-4(any) [three PA tubes] is 0.10A.

I don't understand why it is reading differently depending upon the TRANSCEIVE switch position. Bias current "drifting" up is typical of soft Final tubes. Since you have recently worked on the supply, I'd check the Bias voltage at the supply when this is occurring just to be sure it's not drifting "down" (more positive) during this time.

I don't follow what you are saying in your fourth sentence, "I also notice ..."

HI Garey
Actually I try to keep the bias at .07 or lower since I only run CW, butt I can't figure out which reading to accept as the real setting ? The Transceive reading or the Separate reading?
My other statement refers to XMTR GAIN CCW / USB position /TUNE
for setting Bias. -- I notice output when in the Transceive position but not the other two. I don't know if this may have something to do with problem or not.
Finals and driver tubes were replaced 4 years ago and still have good full output - 130/140 watts with no falling off of output.

I've used starter fluid a couple of times. One problem
is that its not pure ether. Real ether is subject to
decomposing into peroxides which are quite explosive.
I think there are safer solvents. Several are available
in hardware and paint stores. Naphtha works on a lot of
greases, it is quite inflamable. Relatively pure naphtha is
available as lighter fluid like Ronsonol. This is what I
maninly use for cleaning camera shutters. It leaves no
residue of pure.
Dry (99+%) isopropanol is available from computer and
electronic supply places. It is also inflamible but is a
relatively safe solvent and not particularly toxic although
one should not breath to much. It does not leave a residue.
Isopropanol is the current solvent recommended by Koak for
cleaning the _emulsion side_ of slides and negatives. It can
damage cellulose based materials so should not be used on
the support side or on certain cellulose based plastics.
Acetone is useful for some greases and does not leave a
residue but it will attack many plastics and paint.
Xylol is another paint store solvent. It will dissolve
certain greases that acetone won't but, again, is a paint
thinner and will attack many plastics and paints.
MEK (methyl-ethyl-keytone) is a wide spectrum solvent.
It will dissolve many plastics and paint but is very
effective for some greases. It will dissolve rubber
including latex gloves.
Tri-chlor was a very effective degreaser with a
relatively selective action on paint and plastic but is no
longer generally available.

Carbon tetrachloride is not generally available. It was the cleaner of choice for film and many other purposes when it was. Generally, Tri-Chlor replaced it due to lower toxicity. However, other solvents will work for both carbon tet and tri-chlor provided one can tolerate the fire hazard. In general there are two classes of solvents: polar and non-polar. They work on different substances. Polar solvents include water. Polar solvents will not mix with non-polar types. The choice of as solvent depends on the substance one wants it to dissolve. There is a pretty good although somewhat technical artical on solvents on Wikipedia, a Google search will find it.

I don't know where u can buy straight ether. It used to come in a reddish, soft, gel cap lookin' thing. Sort of a squeezable egg. When u were ready to use it u punched a pin hole in one end & squirted it in the carb or air intake. I haven't seen one of those in years. Now what u buy is "starting fluid". Straight ether wipes the oil from the rings & is hard on an engine (compared to the bang it makes inside the cylinder the lack of lube is a minor issue me thinks.....if it starts w/o blowing the head off ur in gud shape !), so anyway starting fluid supposedly has an upper cylinder lube added. One might guess this would leave some kind of residue.

I may have led u astray by even mentioning this. Ether as a cleaner is BIG MEDICINE ! I wouldn't use it on anything that wasn't in really bad shape, maybe some old military boat anchor that u rescued from a garage with 50 yrs of grime on it. In that case any residue left behind would be minor compared to what u started with. I don't know if it's safe for plastics, I'd be careful of that. If u sprayed it inside a radio u should be prepared to re-lube every variable capacitor bearing & anything else that moved or turned or slid. It strips a thick layer of grease & dirt off the side of a D 8 Cat engine like a super pressure washer !

Everyone I've ever talked to (who I thought knew something) has recommended "DeOxit" as a cleaner for electronic switches pots etc., here's a couple of links:

http://store.caig.com/s.nl/sc.2/category.188/.f

http://www.all-spec.com/products/Caig%20Laboratories/Cleaners_and_Aerosols%7CCleaning_Supplies%7CCLN-00/DCC-V510.html

They make several varieties but D5 is recommended for flushing action on vintage equipment.....high dollar but won't wreck stuff or blow u up.....something to be said for that.

Butch KA4MIC / nnn0zei
In the back woods of Kentucky

PS. Here's a couple of TOTALLY off topic vids showing alternate uses of ether.

The right way:

http://www.youtube.com/watch?v=dJ1k0WuNspk

The wrong way (it doesn't take much) :
http://www.youtube.com/watch?v=KI38RZ2f6Ls&feature=related

The most common way:
http://www.youtube.com/watch?v=y6efzYWXhvw&feature=related

PPS. Another form of excitement around here has been inflating a garbage bag w/ the gas from a properly adjusted but extinguished Oxy/Acetylene torch & then setting it off from a safe distance. A MAJOR problem involving static electricity was discovered w/ this activity

& so far as I know it is not currently practiced. Sorry, no pics.

I'm working on an old Hammarlund that has had 2 diodes substituted for the rectifier tube, a 5U4-GB. Is there any problem w/ that ? Voltages seem to be OK & I beleive the radio's problem is a bad audio amp tube.

Tnx,
Butch KA4MIC / nnn0zei

Vacuum tube rectifiers have a much higher voltage drop
than diodes. If the voltages are OK then its OK but be
careful. Another feature of vacuum tubes is that the DC does
not appear until the filiments have warmed up so it does not
apply HV to cold tubes.
What model is this?

It's an HQ110A VHF 160 thru 2 mtrs. It's in very nice shape but no audio, not even the calibrator. It was working (sorta) recently. I could probably change it back to original pretty easy. The tube socket is still there. R U familiar w/ this one ? What do u suggest ? New tubes r on the way.

I apologize for the non Drake content but it's still an old boat anchor, Hi Hi.

Hi

I have exactly the same problem with my T-4XC. Every now and again I have to reset the bias which has usually gone high. After a while I find it has gone low etc.

Strangely, this occurs with both my AC4's one of which was recently uprated with an AC4R. Also, the PA's are new - only put them in a month ago. I also get about 10 watts out in the tune position with no gain applied and this varies with the setting of the bias. Turn the bias down and the output goes down - turn it up and output goes up.

Other than that Tx works fine.

Hi Vic
Thanks for the report-Glad I'm not losing my mind. I'm going to keep
checking on it and see if I can figure it out. I was going to try
another set of finals but after reading your post, I guess
that is not worth trying.

Hi Wink

I wouldn't bother trying a new set of finals. I bought two sets (ouch!) and they both do the same thing with both AC4's. Unless both sets of finals are faulty and both AC4's (each or either) then the problem lies elsewhere.

The Tx works fine but I'm not clever enough to figure out how I get output (10 watts) on normal bias setting which varies up or down when I re-adjust the bias.

Hopefully someone may have had a similar experience and know the answer.

Vic - G4JSS

PS Have had the rig on for two hours now and the standing current reads normal but I am still showing 9 watts out on the power meter - with gain control at rock bottom.

I have that model also - have you replaced the capacitors? The audio could be affected by a bad bypass capacitor on the cathode of the audio tube. Haven't looked at the receiver for several years but the caps seemed to have made a more dramatic difference than the tubes.

I haven't done anything to it yet except change to a grounding AC cord & removed the 2 diodes that had been installled to bypass the rect. tube. Looks to me like the original wiring is untouched so I'll just plug a new tube in there. I have a set of tubes coming + substitute caps to replace the filter caps & some other spare caps just in case I need them. If I'm reading the schematic right that's a .005 on the cathode & I don't believe I have that value. The audio tube gets REALLY hot !

Tnx for the heads up.
BTW, how do u like the receiver ? I never had a Hammarlund before but I've always admired their looks. Maybe I should but some blue gels behind the dials.....talk abt COOL !!!

b

PS. There is a Hammarlund group but no activity.

Butch, I forgot to mention this. There are some good reasons for solid stating the rectifier tubes. One, less heat, and two if your power supply is marginal what you save by SS the rectifiers can help other components. But like was mentioned, you need to be careful because of the instant current flow and higher voltage.

From: Ken Simpson, W8EK
Topic: 3048 Message: 3048

Drake items for sale:

Drake TV-3300-LP Low Pass Filter
This is a modern low pass filter to go between your transmitter and antenna, and has been optimized to have more attenuation in the 40 MHz region, where many TVs have their IF. It is good for 1000 Watts "average" according to the manual, and has over 80 db attenuation at 41 MHz. This one looks great, and includes the paper work. $30

Drake TV-5200-LP
This is the more modern version of the Drake TV-1000 Low Pass Filter. This is the filter that may also be used on the low end of six meters, as well as HF. It is good for 1000 Watts average below 30 MHz, and about 200 W up to 52 MHz. It works fine, and is in very nice shape. $35

Case for Drake TR-33 C
This is the black case that fits the Drake TR-33 C, and has cutouts in the back for antenna, power, etc. It includes the shoulder strap, and is in good shape. $12

Case for Drake TR-22
As above, but for the TR-22. No shoulder strap. $10

3 pin mic plug for TR-22
This is the small 3 pin mic plug that fits the Drake TR-22 mic jack. It is much smaller than most of the mic connectors. I thought these were completely gone, but one appeared from a silent key. This one has been used, but should still be usable some more. $10

Microphones:

Shure 104 C, Low Z hand Microphone
This is a very heavy duty Shure mic. It appears to be new, with stripped and tinned ends that have never been on a connector. It is in its original box, with the original instruction manual. $30

Generic Hand Microphone
This is a low impedance hand microphone, black in color. It is presently has an 8 pin round connector, wired for Kenwood. $25
As above, with no connector. $22

Regular hand microphone
Electret Condenser microphone
Generic Black mic, with gray PTT bar. Requires polarizing
voltage. $25

Lafayette EAM-15 dynamic hand microphone
2000 ohm impedance can be used any place a dynamic mic is needed.
Stripped and tinned leads.
It works fine, and looks good also. $25

CW Items:

Vibroplex Brass Racer Triangular Iambic Paddle

The Brass Racer Paddles are unique in that there are no springs
in the design. Tension on the paddle is infinitely adjustable by
the use of magnets. It is a convenient, space saving portable
keyer paddle unit crafted from solid brass with a lacquer coated
brushed finish mounted on a hardwood base. Designed for use with
an external keyer or a keyer built into the radio. It has a long
shielded cord with a 1/4 inch stereo plug. It works fine and
looks good. $100

"Code Crash" by Jerome Mintz
This is a VHS video tape that teaches a person the code.
It is a very basic tape, with the assumption that one does
not know any of the code. $12

Cable for straight key
About 3 feet long, with a mono 1/4 inch phone plug on it,
as is used with a straight key. $5
As above, but 1/8 inch (3.5 mm) plug. $5

Cable for paddles
About 3 feet long, and with a 1/4 inch stereo connector
on the end, like used by most rigs. $8
As above, but 1/8 inch (3.5 mm) plug $8

Coax connectors and adapters:
Prices are per connector. Several of each are available.
These are NOS (have not been used).

BNC male for coax cable
standard type - $2
crimp on type - $3

Chassis mount BNC female
square mount (uses 4 screws) - $3
screw in type - $4

BNC 90 degree - female to male - $3

BNC "T" - two female and one male - $4

Antenna adapter to fit the BNC connector on the HT
and provide an SO-239 connector that will permit
a PL-259 to be attached. (BNC male to UHF female) $5

UHF Male (PL-259) to BNC female (opposite of above) $5

UHF double female "Barrel connector" (two SO-239 together) $3

UHF "T" connector with two female (SO-239) and one male
(PL-259) connection - $5

Prices do not include shipping from Florida.

Thanks.

Usually when replacing a tube rectifier with silicon diodes a dropping resistor is necessary. The value of the resistor depends on the current drawn by the circuits and the drop in the original rectifier so it must be determined experimentally. Usually the value is pretty low. Some care must be excercized in locating the resistor because it will radiate some heat. The power lost in the diodes is so low that generally they do not run hot.
There are two types of vacuum tube recifiers found in receivers (and sometimes in low voltage sections of transmitters). One is the common filamentary cathode type, such as the familier 5U4 or 5Y3, the other has a separate cathode similar to the heater/cathode in receiving tubes. These have much lower voltage drop than the filamentary kind. The 5V4G is an example of this type. They give somewhat better regulation than the filamentary type where the demand varies.

I've changed the subject field. The problem is probably
not the change in rectfiers but I would check the wiring to
make sure that some part of the RX was not disconnected. The
first step should be to measure the socket voltages as
indicated in the handbook. There are a couple of handbooks
and schematics on BAMA (use the reflector site, the main one
is down) and there may be better ones elsewhere. Also check
the socket resistance values. Socket voltages are measured
with the RX operating so use some care. This may answer the
question right away.
The other trouble shooting technique is to trace the
signal with a good oscilloscope. In this case I would begin
at the detector to see if there is a, RF getting to it, and
if so, b, if there is audio out of it. That will help
isolate the problem. If there is no RF at the detector then
its necessary to trace back toward the input of the receiver
to see where you _can_ find a signal. One can start from
either end but checking the audio and detector stages first
may save some work. A good HF scope will have enough
sensitivity to see all the signals from at least the output
of the RF amp stage. The fact that there is no noise and
that nothing can be heard when the BFO is turned on suggests
the problem is at the detector or following audio stages.
While Hammarlund says that problems with this RX are
usually due to bad tubes they go on to describe noise and
hum problems. Tubes very rarely fail completely so I don't
think this is a tube problem. It is worth seeing if any of
the tubes are cold after operating for a few minutes. Some
filaments are hard to see but if there has been a failure of

either the filament or wiring to it the tube will feel cold.
Other than general trouble shooting hints I have no
specific knowledge of this receiver. I mainly know the older
Hammarlund stuff like the SP-600 and earlier Super-Pro
models having had to trouble shoot several of them.

I have checked most of the voltages & resistances. In general the voltages were a little high but not by a large amount. I'm thinking this could have been due to the diode substitution, they're gone now.. The resistances that I've checked seem well within tolerances.

I've never had a nice scope but I closed the deal on a Sencore SC 61 from ebay today. Now all I need to do is learn how to fly it......assuming it arives in working condition.

I have the Hammarlund manual & schematic & have tried to draw out a block diagram to help get it straight in my mind. It keeps coming back to one of the 2 audio stages but I can't go much further until the new tubes arrive.

Tnx for helping w/ this project even tho it's an "off brand".

Tubes don't often fail catastrophically, usually they
become weak or noisy or develop low resistance paths such as
heater to cathode leaks. A lot of tube testers don't check
for this very will and will show bad tubes as good. Heater
to cathode leaks can cause hum but also chanes in gain with
small variations in heater voltage. Tubes which have
developed a little gas can also cause a variety of problems
from noise to being conductive when they should not. The AVC
circuits in the Drake B and C receivers are evidently quite
sensitive to small amounts of leakage. Tubes can become
gassy without the envelope being damaged, the gas is
generated from internal components. There are gas scavengers
in the tube (getter) but they may not always work or be
overwhelmed. There are several sources of gas, mostly due to
emission from stuff that gets hot. In production the tube is
baked to drive off gasses but sometimes, especially after
forty or fifty years, some will come out.
My suspicions are directed toward open resistors or
shorted caps. Unfortunately, the HQ-110 uses small printed

circuit assemblies in the AF coupling circuits. These were once made unter the name Couplate and were cheaper than descrete parts. They make trouble shooting more difficult. The HQ-110 schematic shows the schematic and values of the couplers used so that, if worst comes to worst, you can duplicate them and replace them.

The receiver is "not bad" considering the time in which it was designed and built. The biggest thing I remember about it is that it drifts - I still have it along with about 20 Hallicrafters and National receivers in my storage shed, waiting their turn on the bench and a new life.

I have found with the Drake 2B and the HQ-110 that putting a new cathode bypass cap on the audio output tube made a very dramatic difference - Can't remember if the audio tube got abnormally hot on the 110.

I think I like the HQ-140(A [model?]) the best of the Hammarlunds - it seemed to be a step above the Hallicrafters.

What exactly is the problem with SSB, drift or something
else?
Caps are available from the internet. High voltage caps
are still made but are not carried by many supply stores
because they don't sell enough. Tom, at Haystack Hamfest may
have what you are looking for although he says he is having
supplier troubles at the moment. He sells multi-section can
caps for Drakes and some Hallicrafters receivers. I just
bought a can for my R-4B which is identical to the original.

What does the CW note sound like, tuning through a carrier?
(You remember carriers; we used to use them).

This is my suggestion too. A garbled sounding SSB
signal can come from the BFO either warbling or hummy (is
that a word?). If the CW signal is clean report back and we
will think up some other stuff to check.

Latest report:

I worked up enough energy to go back at it for awhile this evening. Retubed the whole thing & now have audio & plenty of sensitivity but no BFO or calibration sig at all. It receives AM only. SSB is just what U'd expect from an AM receiver.

When the BFO is switched on the receive goes dead & is replaced by a Hummmmmmmmmmmmmmm. As near as I can figure the ske-matic if the 60MF section of the filter cap were shorted u might expect just that.....

The guy who sold me the tubes was supposed to include appropriate caps to replace all that but they didn't show up. Oops !

I cud not find a link to "Haystack Hamfest" among the 10 gazillion google results (didn't check every one). Did find some other folks who sold can caps, mostly for extortionist prices so I guess I'll just order some modern electrolytics from Mouser or somebody like that.

What chew think ? I'll admit there have been other occasions when I thought I had found THE answer & it turned out that I had just stubbed my toe instead. I try not to be one of those folks who turns down gud advise.....even tho I DID sell my TR4. Oh well, as we move down stream stuff comes & goes.

Tnx,
b

From: David & Chris Drake
Topic: 3033 Message: 3062

Hello to all,
I routinely work on antique radios. There are many many parts sources for the Halli's and Hammarlund's, as well as most any other rigs of the late 50's and 60's. Some parts, however, require a donor radio, which I hate to do, but sometimes necessary.

Here's a few to bookmarks/links:,
http://angela.com/capacitors.aspx

Like the above, ...there are many sites that cater to vintage tube guitar amps, so don't hesitate to google up "tube guitar amps". These old tube guitar amps are one of the primary reasons we still have tubes available today. Also google "tube audio" for another list of links to tube parts. Power supplies in tube guitar amps are pretty much the same as many of the old radios. Some with SS rectification, some with 5u4's and 5y3's as well as others. There are even some diode kits to convert a socket to SS, however approach this with care, particularly when thinking of converting an old Hickok tube tester. Go to Alltubetesters.com for more info on this topic.

More links:

http://www.magicparts.com/main.htm
http://store.triodestore.com/
http://www.alltubetesters.com/index.htm
http://www.radiolaguy.com/misc.htm#250ohm
http://www.oselectronics.com/
http://www.wjoe.com/capacitors.htm#top%20of%20page
http://www.firebottle.com/aes/tubesandmore.cgi?page=gtr_amp_parts
http://www.vacuumtube.com/capacito.htm
http://www.hoffmanamps.com/index.html

Hoffman amps, above, has/carries lots of parts applicable to old radios.

http://www.mojotone.com/ , for tubes, transformers and other parts.
And:
http://www.justradios.com/capacitors.html

I've used Just Radios before. Good folks and good results, plus good prices. This site is mostly for capacitors for old tube desk radios. They can also supply schematics as well.

Have fun with the links.

I want to pass along a source I've been using for tubes.

Joe Schanble
joenmary75@...

He sells on ebay but I deal w/ him direct. He's sold me tubes for a HW 101 & the Hammarlund that u've been hearing abt for abt a third of what others on ebay offer. Many tubes r $1. A complete set of tubes has typically been less than $20 w/ shipping, some used, some NOS. I also bought a pound of resistors for $5 ... it's a nice box full + caps & other stuff.

He's a nice guy to deal w/ & prompt. I have no business interest here other than passing on the good word abt someone.

For any of u Drake people who might be interested.....

Update- The project moves slowly forward. U may not believe this but there's more than 1 thing wrong w/ my Hammarlund HQ 101 VHF.

2 tubes got the audio back
3 caps got the BFO & calibrator working

It now receives both AM & SSB, has a pretty bad hum, is not very sensitive & if u turn the AVC on it turns the reception off.

The guy said it worked, more than once. I've heard that old people stay sharper if they have mental challenges. I'm lookin' for a fancy "Wave Form Analyzer to come rollin' in here Tuesday. I'll set that baby up & start seein pictures of ever little hot part. It'll be figured out in no time !

The alternate could be stickin that fancy probe down in there & gettin 350V sparks all over. No problem......NO FUSE !

Regards,
Butch karmic

What you need more than anything is a decent
oscilloscope. If there is hum its most likely bad filter
caps. It _could_ be a tube with bad heater to cathode
leakage but filter caps are much more likely. I don't
remember if this RX has a separate negative bias supply for
the RF gain and AVC systems, Hammarlund likes that system
and may have used it here. If that supply is malfunctioning
it could explain both the hum and muting when the AVC is
used. Also, of course, see if the RX has any sort of mute
system for transmitting, if so it may be set incorrectly.
The last time someone told me something worked it

turned out that it did! This was a Zenith solid state portable RX I bought. Didn't turn on when I got it home but that turned out to be dirty battery terminals. OTOH, I bought a General Radio bridge some time ago that I was assured was in excellent condition, it was far from that, a mess although I got it working OK. You just never know, but all too often what people mean when they say something works is that the dial lights come on.

3066. Balanced Modulator Problem in T-4XB

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-16 02:42:21 UTC
From: Richard Knoppow
Topic: 3066 Message: 3066

I've written about this before. Some time ago I bought
a T-4XB which was supposedly in good condition. I had no
power supply so had to wait until I aquired an AC-4 and
repaired it in order to test the transmitter. What I found
was that everything seemd to work OK but I could not get a
good carrier null. I of course tried all the obvious stuff,
diodes (the right kind) and checking for resistors that had
changed values a lot. I could find nothing. I also changed
the variable capacitor (barrel type) because I damaged it.
This has been one of the most frustrating problems I have
ever tackled. I tried just about everything I could think of
or that was suggested. For those to want to suggest it comes
from a leaky tube or some bias I will tell you I can get the
same problem using an external signal generator with
everything stripped off the assembly and using a scope to
look at the output.
I managed today to get a null. I finally wised up and
used the differential input to the scope to check the levels
on the two build out resistors, R-6 and R-7, I found a
considerable difference with R-6 being the higher. What I
tried was to add a small value capacitor, about 10pf to
ground from the diode end to ground. That puts the null pot
and null capacitor right in the center of their range. I get
good SSB with no residual carrier. However, and this is a
big however, this cap should not be necessary and I don't
like makeshifted repairs like this. I would really like to
know what is causing the problem. The frustrating part is
that I have tried disconnecting or replacing nearly all
parts. This includes detaching the leads to the primary of
the transformer.
One question I have is what sort of output level should
I expect from the balanced modulator secondary? I can tune
properly and get plenty of drive for CW but am not sure I am
getting full power for SSB. I am testing on 80 meters. The
finals in this rig are not in good shape (I have
replacements) but the fact that CW output is good suggests
that, assuming the output _is_ low, that its not the finals.
I also get decent AM. I have yet to measure the output
voltage using the scope, which I should do but am too stale
at the moment.
Can anyone tell me what is going on here? Gary, have you
ever seen a similar problem?

Subject: [DrakeRadio] Balanced Modulator Problem in T-4XB

> I've written about this before. Some time ago I bought
> a T-4XB which was supposedly in good condition.

More: I just couldn't stand waiting so I tested the
output level. I used both the scope and a dummy load and
watt meter. I used an external tone going into the mic jack
for SSB (actually a mic close to a speaker). The scope is a
Tektronix 453 with a 10X probe conneced across the coax
using a General Radio T connector and 874 adaptor on the T.
The coax consists of two low-loss patch cords with UHF
connectors on one end and General Radio 874 connectors on
the other. The total length of the cable is about 8 feet.
Results: (remember bad finals) about 80w at 3600 khz on
CW or SSB peak (steady tone), same envelope level on the
scope. I can see the ALC working when I jack the input level
up beyond a certain point. This is the same level I got
before sticking the extra cap into the ring modulator. I
have to work tonight so I will put off changing the finals
to see if that makes a difference in output level. I do know
that the level on the higher bands is very limited, may be
no more than 20 watts on 10 meters. I _know_ the finals are
bad. I have a couple of new GE tubes to try.
If the extra cap does no harm, and if no one can suggest
the _real_ solution to this, I will just leave it alone and
put it on the air, at least as soon as I can rig an
antenna:-)

3068. R4A PS transformer

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-16 04:33:03 UTC
From: brooksie1
Topic: 3068 Message: 3068

Hi all,

I'm searching for a replacement transformer for the one in the R4A receiver. I looked at the schematic I have, and I can't find specs for the secondary windings. I'm assuming mine is bad; something "popped" while I was out of the room while it was on, and when I got back in the shack the tranformer was blistering hot, and there was a slight haze in the room (the 3/4 amp fused had been replaced with a 10 amp fuse!).

Parts sources would be greatly appreciated for what will likely be a rebuild of the power supply.

73 and thanks,

jim

I would disconnect the secondaries first and test them. The probability is
it is not the transformer. It is probably a capacitor.

3070. Question for 'B' Operators

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-16 20:54:18 UTC
From: Joe
Topic: 3070 Message: 3070

We have an older gentleman here in Reno that has a B series Drake twin. He is only a Tech so cannot use anything but the lower 10 meter portion of the radio.

However, he is quite a 'listener'. He plugged the R4-B in and connected a wire to the antenna plug, in the belief he could listen in on the different bands...but.....

Only 1 tube gets warm..all the others stay cold. Evidently the filaments are not energized.

Does the TX4-B transmitter and Power supply have be connected for the receiver to work?

Or does he possibly have a set of dead tubes? (Radio hasn't been used for 15 years and has been shipped from Germany since the last time it was turned on)

Thanks!

Joe Wolfe
WA6RKN
Reno, Nevada

The R4B Rx works all by itself.. If only one tube lights then (with power off) pull each tube one at a time and then plug them back in. Look at the tubes in a dark room to be sure whether or not they are glowing.

There is a switch on the RIGHT SIDE that says CRYSTAL/VFO. Make sure that switch is in the VFO position.

Joe,
I used my R-4C for "audio voyeurism" independant of the transmitter/power supply for quite some time. The only thing wiring up the transmitter did was provide a jack for a PL259 from a 'real' antenna. Prior to that it was just an RCA plug into the receiver and alligator clips to a bare wire..

Probably needs tubes or internal work..

Subject: [DrakeRadio] Question for 'B' Operators

We have an older gentleman here in Reno that has a B series Drake twin. He is only a Tech so cannot use anything but the lower 10 meter portion of the radio.

However, he is quite a 'listener'. He plugged the R4-B in and connected a wire to the antenna plug, in the belief he could listen in on the different bands...but.....

Only 1 tube gets warm..all the others stay cold. Evidently the filaments are not energized.

Does the TX4-B transmitter and Power supply have be connected for the receiver to work?

Or does he possibly have a set of dead tubes? (Radio hasn't been used for 15 years and has been shipped from Germany since the last time it was turned on)

Thanks!

Do you have a manual for the R-4B?

Yup..The original, in fact. BTW....This is the cleanest set of B twins I have seen in a long, long time. Absolutely no fungus/staining crud on the copper in both the T or the R....the varnish has aged so the patina is a deep golden color rather than bright copper. I am probably going to end up with them..I hope so....be nice to get a legacy radio I don't have to restore cosmetically! LOL.

You do not need the transmitter at all for the RX to
work. If the dial and meter lamp light the tubes should
light. If they don't its possible that some of them have
corroded pins or are burned out. Tubes seldom burn out.
However, since the radio was in Germany the last time it was
used it may be wired for 240V. There are two primary
windings on the power transformer, for 120V they are wired

in parallel, for 240 in series. My bet is that they are in series. The lamps and tubes may be lighting but dimly. I don't think the RX will work when on the wrong voltage.
For stand-alone operation you should also make a shorting plug for the "external mute" jack. This is just an RCA plug with the center pin shorted to the outer contact. When the is no pin and no connection to the TX the receiver will be muted in the "external mute", NB (noise blanker), and Cal positions of the function switch.
If the RX _is_ jumpered for the correct line voltage (my bet is that its not) take the tubes out and scrub the pins with a toothbrush and something like Barkeeper's Friend or Zud, make sure they are well rinsed. Then squirt just a little contact cleaner on them and put them back in the sockets. Rock the tubes in the sockets to clean the internal contacts. Tube filaments can be checked with a simple ohm meter. They will show either a fairly low resistance or an open. If they are open replace them. If the set was ever connected to 240V with the transformer set for 120V it may have burned out the tubes and done other damage. This _should_ have blown the fuse but may have caused some trouble before it opened up. I hope this did not happen.

Since you also have the transmitter check it also for
the correct line voltage wiring.

Oh, dear, another thing I forgot. If you do not have the
manuals I recommend you get the CD from Gary Burrell which
has both RX and TX manuals and a lot of other stuff on it.
There _are_ some decent downloadable manuals on the web but
the ones at BAMA are very low resolution and not too useful.
Gary's web site is:
http://www.k4oah.com/

Dan...

Vintage Manuals has them for $13.00, if you can't get a copy from someone
and decide to pay.
RadioEra is another fee based source...$20.00

3080. TR-4C Volume/ RF Gain pot needed

Yahoo group: DrakeRadio (2006 — 2011)
Date: 2010-01-17 01:07:57 UTC
From: lonelyone_64109
Topic: 3080 Message: 3080

I am looking for a replacement volume/RF gain/power switch potentiometer for my TR-4C. The volume control will not reduce the sound down to a low level (the pot seems to have excessive "play" in the fully counter-clockwise position.The RF gain pot and power switch work fine. Does anyone have one that needs a good home or knows of a company where I can get a replacement? Are both pots audio taper or is the volume control an audio taper and the RF one a linear taper?

Richard et all,

I'm not sure what the groups tolerance is for discussions of other brands. I'm thinking this thread MIGHT be generally informational enough to be welcomed however if that is not the case a moderator or the list owner just needs to say something & we can take this off list.

That said.....

I have purchased a Sencore SC 61 oscilloscope which I'm looking for next wk. It may or may not be working properly but I'm hopeful. I've played around w/ them previously but never applied one to a technicality like I'm into now. Sooooo....U & others have been very helpful so far & maybe if I do end up w/ a working scope u folks might provide a few clues as to how to use it for this kind of trouble shooting.

I'm actually having to work this wk end photographing a horse show, (it's amazing that I get by so well just on my gud looks- hi hi). Once I get that nasty piece of business taken care of I figure some more voltage & resistance checks r in order. I'm not discouraged (yet) as I am making steady progress. Thru the yrs I've learned some things even from projects that have not panned out well.

Tnx to everyone,

Butch

Hi Joe!

Thanks for the reply! I have seen places where I could purchase a copy of one, but I would rather purchase an original from a fellow ham or download a pdf.

I appreciate the website information though.

Dan

Your are a photographer too? We really must contact
each other off list. Do a Google search for me for more.
Oscilloscopes are among the most powerful tools for
electronics there are. Even old uncalibrated ones can tell
you a lot and more modern ones with voltage and time
calibration can be used to measure nearly anything. Because
they are very sensitive and generally have very high input
```

impedance they can be used to probe around in circuits with minimal disturbance. So, they are a combination of a signal tracer, voltmeter, frequency or period meter and, with a little interpretion a wave-form analyser. Many modern scopes also have more than one input channel and means of comparison of the inputs. Many also have a means of combining two inputs in or out of polarity. When one is reversed the scope becomes a differential instrument showing the _difference_ between the two inputs. This can be a very useful function. If the Sencor scope you are getting is the one I am picturing in my mind is what I am terming a modern scope, that is, one with calibrated sweep and voltages plus some relatively sophisticated trigger circuit. There have been many books written about how to use an oscilloscope. I think both Tektronix and Hewlett-Packard published something. I need to search my electronic files to be specific. If I have what I think it or they are available off the web for free.

Scopes have the usual problems with dirty pots and switches. They can have more serious problems but that should wait unti you have the beast and see if it works. I think there are some Sencor instruction books on the web in case it comes without one.

As far as the Hammarlund goes I think trouble shooting is a sort of special talent which is applicable to all sorts of things. So, as long as the members of the list tolerate it perhaps even a disussion of some other make of radio may prove helpful with Drake stuff. Otherwise I will be glad to continue via private mail if you like. This list has been very helpful to me and I certainly do not want to abuse it in any way.

Subject: Re: [DrakeRadio] Balanced Modulator Problem in T-4XB

Progress report.
I replaced the finals. I used the neutralization method suggested in the handbook and ammended on Gary's site (I think), anyway, it seems to work.
I ordered a power supply kit from the Heathkit Shop. He tells me that some of the caps are on back order so it will be a month until I get it. The supply currently has excessive ripple.
I found no output on 20 meters. After poking around a little I decided to check the tuning. It was way off. I did the tuning procedure and now get something like 80 watts on CW. I will do a complete tuning procedure tomorrow. I thought I had done this already but now think I did only a couple of bands because there were too many other problems.
I went after the AM distortion problem by first measuring the tube voltages in a couple of places, particularly of V-11, the control tube, looking for a gassy tube or a bad coupling cap. voltages were near but not right on.
Looking at the circuit I decided the problem with AM might be a gasst screen control tube. I could not find any spare 6AU6 tubes although I know I have some new ones someplace. So, I swapped the two tubes in the RX assuming the problem would at least change. The distortion went away. OK, fine. I swapped the tubes back, still no distortion. Perhaps dirty tube pins. I will still get a couple of new tubes. The curious thing is that there is both a 6AU6 and a 6AU6A in the set and the sockets are marked that way. The 6AU6A is a later version of the 6AU6 but not much different. Usually, the later version of a tube can be used for the earlier version but not always the other way around. I wonder why Drake did this.
